Design Guide for Concrete-filled Double Skin Steel Tubular Structures Lin-Hai Han,Dennis Lam,David Nethercot,2018-10-12 This is the first design guide on concrete filled double skin steel tubular CFDST structures It addresses in particular CFDST structures with plain concrete sandwiched between circular hollow sections and provides the relevant calculation methods and construction provisions for CFDST structures These inherit the advantages of conventional concrete filled steel tubular CFST structures including high strength good ductility and durability high fire resistance and favourable constructability Moreover because of their unique sectional configuration CFDST structures have been proved to possess lighter weight higher bending stiffness and better cyclic performance than conventional CFST Consequently CFDST can offer reduced concrete consumption and construction costs This design guide is for engineers designing electrical grid infrastructures wind power towers bridge piers and other structures requiring light self weight high bending stiffness and high bearing capacity

Design of Welded Tubular Connections P.W. Marshall,2013-10-22 Although tubular structures are reasonably well understood by designers of offshore platforms onshore applications often suffer from learning curve problems particularly in the connections tending to inhibit the wider use of tubes This book was written primarily to help this situation Representing 25 years of work by one of the pioneers in the field of tubular structures the book covers research synthesis of design criteria and successful application to the practical design construction inspection and lifetime monitoring of major structures Written by the principal author of the AWS D1.1 Code Provisions for Tubular Structures this book is intended to be used in conjunction with the AWS Structural Welding Code Steel AWS D1.1 88 published by the American Welding Society Miami FL USA Users of this Code writers of other codes students and researchers alike will find it an indispensable source of background material in their work with tubular structures

Unified Design of Steel Structures Louis F. Geschwindner,2011-12-20 Geschwindner's 2nd edition of Unified Design of Steel Structures provides an understanding that structural analysis and design are two integrated processes as well as the necessary skills and knowledge in investigating designing and detailing steel structures utilizing the latest design methods according to the AISC Code The goal is to prepare readers to work in design offices as designers and in the field as inspectors This new edition is compatible with the 2011 AISC code as well as marginal references to the AISC manual for design examples and illustrations which was seen as a real advantage by the survey respondents Furthermore new sections have been added on Direct Analysis Torsional and flexural torsional buckling of columns Filled HSS columns and Composite column interaction More real world examples are included in addition to new use of three dimensional

Tapered Tubular Steel Structures National Electrical Manufacturers Association, 1977 **Optimum Design of Steel Structures** József Farkas, Károly Jármay, 2015-05-19 This book helps designers and manufacturers to select and develop the most suitable and competitive steel structures which are safe fit for production and economic An optimum design system is used to find the best characteristics of structural models which guarantee the fulfilment of design and fabrication requirements and minimize the cost function Realistic numerical models are used as main components of industrial steel structures Chapter 1 contains some experiences with the optimum design of steel structures Chapter 2 treats some newer mathematical optimization methods Chapter 3 gives formulae for fabrication times and costs Chapters 4 deals with beams and columns Summarizes the Eurocode rules for design Chapter 5 deals with the design of tubular trusses Chapter 6 gives the design of frame structures and fire resistant design rules for a frame In Chapters 7 some minimum cost design problems of stiffened and cellular plates and shells are worked out for cases of different stiffenings and loads Chapter 8 gives a cost comparison of cylindrical and conical shells The book contains a large collection of literatures and a subject list and a name index *Behaviour and Design of Cold-Formed High Strength Steel Tubular Members* Jialin Ma, 2017-01-26 This dissertation Behaviour and Design of Cold formed High Strength Steel Tubular Members by Jialin Ma was obtained from The University of Hong Kong Pokfulam Hong Kong and is being sold pursuant to Creative Commons Attribution 3.0 Hong Kong License The content of this dissertation has not been altered in any way We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation All rights not granted by the above license are retained by the author Abstract Steel is categorised into mild steel and high strength steel according to the material strengths The material properties of high strength steel usually cannot be simply represented by traditional mild steel stress strain curves thus the behaviour of high strength steel members are generally different from those for mild steel products Tubular members have great potential in structural engineering due to their aesthetic appearance and strong resistance against torsional buckling Cold formed steel tubular sections are preferred in some applications as they are easier and less energy consuming to fabricate when compared to hot rolled steel and built up steel sections The aims of this study are to investigate experimentally and numerically the behaviour of cold formed high strength tubular structural members and develop design guidance for these products The experimental programme in this study included 66 tensile coupon tests residual stress measurements on 3 sections 25 stub column tests 25 beam tests 32 long beam column tests and 83 short beam column tests The tubular sections consisted of 9 square hollow sections 2 rectangular hollow sections and 6 circular hollow sections The

specimens were categorised into three series according to their nominal yield stresses H series 700 MPa V series 900 MPa and S series 1100 MPa The stub columns were tested in fixed ended boundary conditions The behaviour of beams was investigated through four point bending tests The beam columns were tested between a set of knife edges with equal load eccentricities at both ends which provided single curvature and uniform end moment to the specimens Finite element models were developed and validated against experiments using Abaqus software The influences of material properties residual stresses local and global geometric imperfections and other input factors were analysed The results showed that the models are capable of replicating the key test results load deformation histories and failure modes of the specimens Upon validation of finite element models a comprehensive parametric study programme was carried out to supplement the experimental data The parametric study consisted of 321 stub columns 423 beams and 540 beam columns The test and finite element data were further used to evaluate the codified design rules from the current American Australian New Zealand and European design codes for steel structures The Direct Strength Method was also evaluated for the cold formed high strength steel tubular members in this study In the comparison the compactness criteria for tubular sections were examined and the predicted design strengths were also compared to the test and finite element results Improved design recommendations are given accordingly Reliability analysis were performed for codified and proposed design rules Subjects Tubular steel structures Steel High strength Cold working
