Carbon Fibers Filaments and Composites J.L. Figueiredo, Carlos A. Bernardo, R.T.K. Baker, K.J. Hüttinger, 2013-03-14 Conventional synthetic materials like metals ceramics or glass are usually isotropic substances and their suitability for structural applications is achieved by morphological design and combination in the macroscopic scale However in modern engineering this is often not acceptable As an alternative the use of non homogeneous anisotropic

materials with significant stiffness and strength only in the directions these mechanical properties are really needed can lead to enormous material and weight savings This is the case of multiphase systems called composite materials In these composites different material parts are added and arranged geometrically under clearly designed and controlled conditions Usually a structure of fibers provides strength and stiffness and a matrix holds them together whilst providing the geometric form Carbon fibers are among the high performance fibers employed in these advanced structural composites which are profoundly changing many of today s high technology industries New research and development challenges in this area include upgrading the manufacturing process of fibers and composites in order to improve characteristics and reduce costs and modifying the interfacial properties between fibers and matrix to guarantee better mechanical properties The interdisciplinary nature of this new frontier is obvious involving chemistry materials science chemical and mechanical engineering Other topics which more often are treated separately are also important for the understanding of the processes of fiber production Carbon filaments is one such topic as the study of their mechanisms of nucleation and growth is clearly quite relevant to the production of vapour grown carbon fibers

Automotive Carbon Fiber Composites Jackie D Rehkopf,2011-11-29 The development of new materials that are technically and economically viable is no small endeavor The risks costs and time involved in research are usually so high that only governments or private consortia can bear them And so it has been with the trajectory of carbon fiber reinforced composites which are capable of providing the lightweighting needed for fuel efficiency and the mechanical strength required for safety After a long development cycle this material is now being widely used by the military in commercial aircraft and in the automotive industry

Automotive Carbon Fiber Composites From Evolution to Implementation written by Dr Jackie Rehkopf senior researcher at Plasan Carbon Composites gives a high level summary on carbon reinforced fiber composites specific to the automotive industry in today s market and its vision for the next 5 to 10 years It begins with a comprehensive and easy to read overview of how composites started to be investigated as a possible alternative to metals mostly driven by military demands going on to cover Fiber and resin types for automotive applications Composite constructions Manufacturing processes Machining and joining Reclaiming and recycling of these materials among other topics The title approaches the future with the realistic optimism of those who work with the challenges of creating new solutions to problems that will stay with us for some time to come the need to conserve energy and make transportation ever more affordable without the loss of safety Carbon fiber reinforced composites have demonstrated real value in positively addressing these issues

Automotive Carbon Fiber Composites From Evolution to Implementation is an excellent guide for those involved in technical material strategy and research as well as those who need to understand the basics of this subject to support better business decisions
