**Inputs of Nutrients and Pollutants to Hawaiian Coastal Waters from Submarine Groundwater Discharge** Karen Lisa Knee, 2010 Submarine groundwater discharge SGD is a spatially pervasive phenomenon that adds freshwater nutrients dissolved metals bacteria and other constituents to the coastal ocean This dissertation investigated SGD related inputs of nutrients and fecal indicator bacteria Escherichia coli and Enterococcus sp to coastal waters in two Hawaiian locations the north shore of Kauai and the Kona coast of Hawaii Concentrations of caffeine which has been used previously as a wastewater tracer were measured in groundwater and surface water on the north shore of Kauai Both study areas have relatively light levels of urban and agricultural development and maintaining good water quality is essential for their tourism based economies coral reefs fisheries and traditional way of life Radium Ra an element with naturally elevated concentrations in coastal groundwater was used as an SGD tracer and a mass balance approach was used to quantify SGD On the north shore of Kauai agriculture was associated with higher nitrate nitrite concentrations in the fresh SGD component while phosphate and silica appeared to be controlled by geological differences in aquifer substrate High ammonium concentrations in the fresh SGD component at one site may have been caused by a leaky cesspool In Kona no relation between urban development or agriculture and groundwater nutrient concentrations was observed but bare lava rock was associated with higher nitrate nitrite and silica concentrations in fresh SGD Sites closer to golf courses also had higher nitrate nitrite concentrations Conservative estimates of total SGD on the north shore of Kauai ranged from 1.3 to 7.8 L per meter per minute or up to 10% of Hanalei River discharge and SGD contributed significant nitrate nitrite inputs to Hanalei Bay Estimates of SGD in Kona ranged from 5 to 1200 L per meter per minute with between 10 and 100% of the brackish SGD comprised by the fresh SGD component SGD related water and nutrient fluxes on the Kona Coast where no rivers and streams are present were large compared to those reported for other sites worldwide Caffeine concentrations in environmental waters on the north shore of Kauai ranged from 0.88 ng/L on the low end of what has been reported for other locations Metribuzin an herbicide was also detected at concentrations from 4.11 ng/L in five groundwater and surface water samples A sensitivity analysis of Ra based methods of estimating water ages and coastal mixing rates revealed that water ages shorter than 3 d cannot be estimated with confidence using Ra based methods even if the only uncertainty considered is analytical error In conclusion this dissertation provides new data about SGD and related inputs of nutrients and bacteria to Hawaiian coastal waters suggests that even low levels of development may influence nutrient concentrations in coastal groundwater presents the first caffeine concentrations measured in environmental water samples collected in a tropical setting and explores the limits of applicability of Ra based methods of estimating water ages and coastal mixing rates providing guidance for researchers conducting Ra based SGD studies in the future
