Daya Sagar, Qiuming Cheng, Frits Agterberg, 2018-06-25 This Open Access handbook published at the IAMG's 50th anniversary presents a compilation of invited path breaking research contributions by award winning geoscientists who have been instrumental in shaping the IAMG. It contains 45 chapters that are categorized broadly into five parts: i) theory ii) general applications iii) exploration and resource estimation iv) reviews and v) reminiscences covering related topics like mathematical geosciences mathematical morphology geostatistics fractals and multifractals spatial statistics multipoint geostatistics compositional data analysis informatics geocomputation numerical methods and chaos theory in the geosciences.

Advances in Contemporary Statistics and Econometrics Abdelaati Daouia, Anne Ruiz-Gazen, 2021-06-14 This book presents a unique collection of contributions on modern topics in statistics and econometrics written by leading experts in the respective disciplines and their intersections. It addresses nonparametric statistics and econometrics quantiles and expectiles and advanced methods for complex data including spatial and compositional data as well as tools for empirical studies in economics and the social sciences. The book was written in honor of Christine Thomas Agnan on the occasion of her 65th birthday. Given its scope it will appeal to researchers and PhD students in statistics and econometrics alike who are interested in the latest developments in their field.

Applied Microbiome Statistics Yinglin Xia, Jun Sun, 2024-07-22 This unique book officially defines microbiome statistics as a specific new field of statistics and addresses the statistical analysis of correlation association interaction and composition in microbiome research. It also defines the study of the microbiome as a hypothesis driven experimental science and describes two microbiome research themes and six unique characteristics of microbiome data as well as investigating challenges for statistical analysis of microbiome data using the standard statistical methods. This book is useful for researchers of biostatistics ecology and data analysts. Presents a thorough overview of statistical methods in microbiome statistics of parametric and nonparametric correlation association interaction and composition adopted from classical statistics and ecology and specifically designed for microbiome research. Performs step by step statistical analysis of correlation association interaction and composition in microbiome data. Discusses the issues of statistical analysis of microbiome data: high dimensionality compositionality sparsity overdispersion zero inflation and heterogeneity. Investigates statistical methods on multiple comparisons and multiple hypothesis testing and applications to microbiome data. Introduces a series of exploratory tools to visualize composition and correlation of microbial taxa by barplot heatmap and correlation plot. Employs the Kruskal Wallis rank sum test to perform model selection for further multi omics data integration. Offers R code and the datasets from the authors' real microbiome research and publicly available data for the analysis used. Remarks on the advantages and disadvantages of each of the methods used.

Compositional data occur naturally in biomedical studies which investigate changes in the proportions of various components of a combined medical measurement. The statistical method to analyze this type of data is underdeveloped. Currently the multivariate logit-normal model seems to be the only model routinely used in analyzing compositional data and its application is mainly in geology and has yet to be known to the biomedical fields. In this dissertation we propose the multivariate simplex model as an alternative method of modeling compositional data either cross sectional or longitudinal and develop statistical methods to analyze such data. We suggest three approaches to making a fair comparison between the multivariate simplex models and the multivariate logit normal models. The simulations indicate that our proposed multivariate simplex models often outperform the multivariate logit normal models. *Analysis of Compositional Data Using Dirichlet Covariate Models*

Rafiq Hamed Hijazi, 2003 *Modelling Techniques for Compositional Data Using Distributions Defined on the Hypersphere*

Janice Lea Scealy, 2010 Compositional data can be transformed to directional data by the square root transformation and then modelled using distributions defined on the hypersphere. The purpose of this thesis is to investigate new modelling techniques for a general p dimensional compositional data vector using this square root transformation approach. One advantage is that zero components are catered for naturally in the models. The Kent distribution for directional data is a good candidate model because it has a sufficiently general covariance structure. We investigate the properties of the Kent distribution in p dimensions and develop asymptotic normal theory results and an acceptance sampling algorithm. We propose a new regression model which models the mean direction of the Kent distribution as a function of a vector of covariates. Our estimators for the regression model parameters are motivated by asymptotic approximations and moment estimators and can be regarded as asymptotic maximum likelihood estimators. We show that these estimators perform well and are suitable for typical compositional datasets including those with zero components. One advantage of our approach to estimation is that it is not computationally intensive and the parametric bootstrap is used for inference. Using two real example datasets we demonstrate a modelling strategy in practice including how to check the model assumptions. A simulation study is also undertaken confirming the value of our proposed estimators in typical cases. We also demonstrate in certain cases that our new approach for modelling compositional data should work much better than more traditional methods such as those based on logratio transformations.
