Linear and Nonlinear Programming David G. Luenberger, Yinyu Ye, 2015-06-25 This new edition covers the central concepts of practical optimization techniques with an emphasis on methods that are both state of the art and popular One major insight is the connection between the purely analytical character of an optimization problem and the behavior of algorithms used to solve a problem This was a major theme of the first edition of this book and the fourth edition expands and further illustrates this relationship As in the earlier editions the material in this fourth edition is organized into three separate parts Part I is a self contained introduction to linear programming The presentation in this part is fairly conventional covering the main elements of the underlying theory of linear programming many of the most effective numerical algorithms and many of its important special applications Part II which is independent of Part I covers the theory of unconstrained optimization including both derivations of the appropriate optimality conditions and an introduction to basic algorithms This part of the book explores the general properties of algorithms and defines various notions of convergence Part III extends the concepts developed in the second part to constrained optimization problems Except for a few isolated sections this part is also independent of Part I It is possible to go directly into Parts II and III omitting Part I and in fact the book has been used in this way in many universities New to this edition is a chapter devoted to Conic Linear Programming a powerful generalization of Linear Programming Indeed many conic structures are possible and useful in a variety of applications It must be recognized however that conic linear programming is an advanced topic requiring special study Another important topic is an accelerated steepest descent method that exhibits superior convergence properties and for this reason has become quite popular The proof of the convergence property for both standard and accelerated steepest descent methods are presented in Chapter 8 As in previous editions end of chapter exercises appear for all chapters From the reviews of the Third Edition this very well written book is a classic textbook in Optimization It should be present in the bookcase of each student researcher and specialist from the host of disciplines from which practical optimization applications are drawn Jean Jacques Strodiot Zentralblatt MATH Vol 1207 2011

Modeling, Analysis and Optimization of Process and Energy Systems F. Carl Knopf, 2011-12-14 Energy costs impact the profitability of virtually all industrial processes Stressing how plants use power and how that power is actually generated this book provides a clear and simple way to

understand the energy usage in various processes as well as methods for optimizing these processes using practical hands on simulations and a unique approach that details solved problems utilizing actual plant data Invaluable information offers a complete energy saving approach essential for both the chemical and mechanical engineering curricula as well as for practicing engineers

Scientific and Technical Aerospace Reports ,1992 Convex Optimization Stephen P. Boyd,Lieven Vandenberghe,2004-03-08 Convex optimization problems arise frequently in many different fields This book provides a comprehensive introduction to the subject and shows in detail how such problems can be solved numerically with great efficiency The book begins with the basic elements of convex sets and functions and then describes various classes of convex optimization problems Duality and approximation techniques are then covered as are statistical estimation techniques Various geometrical problems are then presented and there is detailed discussion of unconstrained and constrained minimization problems and interior point methods The focus of the book is on recognizing convex optimization problems and then finding the most appropriate technique for solving them It contains many worked examples and homework exercises and will appeal to students researchers and practitioners in fields such as engineering computer science mathematics statistics finance and economics
