

AP Biology - Chapter 5 Cellular Respiration Assignment

- What is the relationship between anaerobic and aerobic biology?
 Anaerobic means "without oxygen" and aerobic means "with oxygen". Aerobic respiration is the process of breaking down glucose to produce energy in the presence of oxygen. Anaerobic respiration is the process of breaking down glucose to produce energy in the absence of oxygen.
- What does an electron transport chain and what is its difference between a lowering and maximum electron potential?
 The electron transport chain is a series of protein complexes in the inner mitochondrial membrane that transfer electrons from one molecule to another, creating a proton gradient across the membrane. The difference between a lowering and maximum electron potential is the difference in the energy levels of the electrons before and after they pass through the chain.
- Describe the process and purpose of cell respiration.
 Cell respiration is the process of breaking down glucose to produce energy in the form of ATP. It consists of three main stages: glycolysis, the citric acid cycle, and oxidative phosphorylation.
- Explain prokaryotic cell division - binary fission and budding.

- What is surface area to volume ratio and importance of it as it applies to the biological world?
 Surface area to volume ratio is the ratio of the surface area of an object to its volume. It is important because it affects the rate at which substances can enter and leave a cell. A higher surface area to volume ratio allows for more efficient exchange of materials with the environment.
