Diffusion Through a Membrane

A Laboratory Activity for the Living Environment

Figure 3.11 Diffusion Through a Membrane

Diffusion is an important process that cells in plants, like cells that are utilized by other organisms, are dependent on. This is because cells, like plants, do not produce by themselves the molecules needed for survival. They must take in molecules of small particles from their environment. However, the cell's cell membrane does not permit particles to move across it at the same rate. Therefore, molecules of small particles are usually distributed unevenly. This distribution is a result of diffusion that occurs over time. In this activity, the distribution of small particles over time is demonstrated using the color dye in the beakers.

When a small molecule moves over a cell's membrane, it must pass through a pore. If the molecule is small enough to pass through the pore, then movement is possible. The movement of small particles from a high concentration to a low concentration is called diffusion.

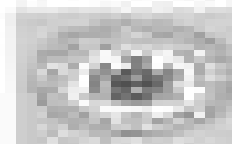

Living cells are surrounded by a membrane that is made of phospholipids. Phospholipids are made of two parts: a hydrophilic (water-loving) head and a hydrophobic (water-fearing) tail. The hydrophilic head is made of a phosphate group, which is a small molecule. The hydrophobic tail is made of two fatty acid chains, which are large molecules. The phospholipids are arranged in a bilayer, with the hydrophilic heads facing outwards and the hydrophobic tails facing inwards. The phospholipids are held together by hydrogen bonds.

Some parts of the membrane are made of proteins. These proteins are embedded in the membrane. Some proteins are made of small molecules, while others are made of large molecules. The proteins are held together by hydrogen bonds. The proteins are also held together by hydrophobic interactions.

Objectives

- 1. To observe the process of diffusion in a living cell.
- 2. To understand how a cell's membrane is made of phospholipids and proteins.
- 3. To understand how a cell's membrane is made of phospholipids and proteins.

Diffusion is the movement of particles from a high concentration to a low concentration. This process is important for cells because it allows them to take in molecules of small particles from their environment. In this activity, the distribution of small particles over time is demonstrated using the color dye in the beakers.
