## Context

When purchasing items, it is often not clear how much the total price will be after discounts. For example, suppose a \$100 item is discounted 10% and then 20% off the total price. One common mistake is to subtract 10% from \$100 to get \$90, and then subtract 20% from \$90 to get \$72. However, when the discounts are applied sequentially, the final price is \$81, which represents a 19% discount from the original price. The correct percentage is calculated by adding the discounts together:  $10\% + 20\% = 30\%$ , which represents a 30% discount from the original price.

Suppose a \$100 item is discounted 10% and then 20% off the total price.

1. What is the final price after the 10% discount?

2. What is the final price after the 20% discount?

3. What is the total discount percentage?

4. What is the final price after the 30% discount?

Figure 1: Computing Total Discounts

Item	Original Price	Discount	Final Price
Apple	\$100.00	10%	\$90.00
Banana	\$100.00	20%	\$80.00
Orange	\$100.00	30%	\$70.00
Apple	\$100.00	10%	\$90.00
Banana	\$100.00	20%	\$80.00
Orange	\$100.00	30%	\$70.00

Figure 2: Applying Total Discounts

As the discounts are applied sequentially, the final price is not simply the original price minus the total discount. This is because the discounts are applied to the price after the previous discount has been applied. For example, if a \$100 item is discounted 10% and then 20% off the total price, the final price is \$81, which represents a 19% discount from the original price.

1. What is the final price after the 10% discount?
2. What is the final price after the 20% discount?
3. What is the total discount percentage?
4. What is the final price after the 30% discount?
5. What is the total discount percentage?
6. What is the final price after the 30% discount?
7. What is the total discount percentage?
8. What is the final price after the 30% discount?
