aware of present day remote access and distributed computer applications The book consists of three parts which deal with prin ciples of distributed systems communications architecture and protocols and formal description techniques The first part serves as an introduction to the broad meaning of distributed system We give examples try to define terms and discuss the problems that arise in the context of parallel and distributed processing The second part presents the typical layered protocol architecture of distributed systems and discusses problems of compatibility and interworking between heterogeneous computer systems The principles of the lower layer functions and protocols are explained in some detail including link layer protocols and network transmission services The third part deals with specification issues The role of specifications in the design of distributed systems is explained in general and formal methods for the specification analysis and implementation of distributed systems are discussed   *Distributed systems* Sunil Kumar,2017   **Distributed System Design** Jie Wu,Taylor & Francis Group,2020-12-18 Future requirements for computing speed system reliability and cost effectiveness entail the development of alternative computers to replace the traditional von Neumann organization As computing networks come into being one of the latest dreams is now possible distributed computing Distributed computing brings transparent access to as much computer power and data as the user needs for accomplishing any given task simultaneously achieving high performance and reliability The subject of distributed computing is diverse and many researchers are investigating various issues concerning the structure of hardware and the design of distributed software Distributed System Design defines a distributed system as one that looks to its users like an ordinary system but runs on a set of autonomous processing elements PEs where each PE has a separate physical memory space and the message transmission delay is not negligible With close cooperation among these PEs the system supports an arbitrary number of processes and dynamic extensions Distributed System Design outlines the main motivations for building a distributed system including inherently distributed applications performance cost resource sharing flexibility and extendibility availability and fault tolerance scalability Presenting basic concepts problems and possible solutions this reference serves graduate students in distributed system design as well as computer professionals analyzing and designing distributed open parallel systems Chapters discuss the scope of distributed computing systems general distributed programming languages and a CSP like distributed control description language DCDL expressing parallelism interprocess communication and synchronization and fault tolerant design two approaches describing a distributed system the time space view and the interleaving view mutual exclusion and related issues including election bidding and self stabilization prevention and detection of deadlock reliability safety and security as well as various methods of handling node communication Byzantine and software faults efficient interprocessor communication mechanisms as well as these mechanisms without specific constraints such as adaptiveness deadlock freedom and fault tolerance virtual channels and virtual networks load distribution problems synchronization of access to shared data while supporting a high degree of concurrency   *Distributed Systems* George F.
