A Robotic Framework for the Mobile Manipulator Nguyen Van Toan, Phan Bui Khoi, 2023-03-07 By proposing and forming a mobile manipulator for modern multi floor buildings A Robotic Framework for the Mobile Manipulator Theory and Application helps readers visualize an end to end workflow for making a robot system work in a targeted environment From a product oriented viewpoint this book is considered as a bridge from theories to real products in which robotic software modules and the robotic system integration are mainly concerned In the end readers will have an overview of how to build and integrate various single robotic modules to execute a list of designed tasks in the real world as well as how to make a robot system work independently without human interventions With references and execution guidelines provided at the end of each chapter the book will be a useful tool for developers and researchers looking to expand their knowledge about the robotics and the robotic software

A Stable and Transparent Framework for Adaptive Shared Control of Robots Ribin Balachandran, 2023-12-28 Robotic research and developments in computing technologies including artificial intelligence have

led to significant improvements in autonomous capabilities of robots Yet human supervision is advisable and in many cases necessary when robots interact with real world outside lab environments This is due to the fact that complete autonomy in robots has not yet been achieved When robots encounter challenges beyond their capabilities a viable solution is to include human operators in the loop who can support robots through teleoperation taking complete control or shared control This monograph focuses on a special form of shared control namely mixed initiative where the final command to the robot is a weighted sum of the commands from the operator and the autonomous controller The weights fixed or adaptive called authority allocation AA factors decide who has more control authority over the robot Several research groups use different methods to adapt the AA factors online and the benefits of adaptive mixed initiative shared control have been well established in terms of task completion success and operator usability However stability of the overall shared control framework with communication time delays between the operator and the robot is a field that has not been examined extensively This monograph presents methods to improve performance and stability in shared control so that the possibilities of its applications can be widened Firstly methods to improve the haptic feedback performance of teleoperation are developed Secondly methods to stabilize adaptive shared control systems while still ensuring high teleoperation performance are proposed The methods are validated on multiple robotic systems and they were applied in several projects both in space and terrestrial domains With the aforementioned contributions this monograph provides an overarching framework to improve synergy between humans and robots The flexibility of the framework allows integration of existent teleoperation and shared control approaches which further promotes synergy within the robotics community

Time-Optimal Trajectory Planning for Redundant Robots Alexander Reiter, 2016-03-11 This master's thesis

presents a novel approach to finding trajectories with minimal end time for kinematically redundant manipulators Emphasis is given to a general applicability of the developed method to industrial tasks such as gluing or welding Minimum time trajectories may yield economic advantages as a shorter trajectory duration results in a lower task cycle time Whereas kinematically redundant manipulators possess increased dexterity compared to conventional non redundant manipulators their inverse kinematics is not unique and requires further treatment In this work a joint space decomposition approach is introduced that takes advantage of the closed form inverse kinematics solution of non redundant robots Kinematic redundancy can be fully exploited to achieve minimum time trajectories for prescribed end effector paths **Automatic**
