NUMBER & CHARACTER

Integer
The integer data type represents whole numbers. It is the most basic of the numeric types. The range of values that can be stored in an integer depends on the implementation, but it is typically between -2,147,483,648 and 2,147,483,647. The integer type is used for counting, indexing, and other operations that require whole numbers.

Float
The float data type represents real numbers. It is used for calculations that require a fractional part. The range of values that can be stored in a float is typically between -3.4e+38 and 3.4e+38. The float type is used for scientific calculations, financial calculations, and other operations that require a fractional part.

Double
The double data type represents real numbers with a higher precision than the float type. It is used for calculations that require a high degree of accuracy. The range of values that can be stored in a double is typically between -1.7e+308 and 1.7e+308. The double type is used for scientific calculations, financial calculations, and other operations that require a high degree of accuracy.

Character
The character data type represents a single character. It is used for storing and manipulating individual characters. The range of values that can be stored in a character is typically between 0 and 255. The character type is used for string processing, file I/O, and other operations that require individual characters.

String
The string data type represents a sequence of characters. It is used for storing and manipulating text. The range of values that can be stored in a string is typically between 0 and 255 characters. The string type is used for text processing, file I/O, and other operations that require sequences of characters.

Boolean
The boolean data type represents a logical value. It is used for storing and manipulating true and false values. The range of values that can be stored in a boolean is typically between 0 and 1. The boolean type is used for conditional operations, loops, and other operations that require logical values.

Enum
The enum data type represents a set of named constants. It is used for storing and manipulating discrete values. The range of values that can be stored in an enum is typically between 0 and 255. The enum type is used for representing categories, states, and other discrete values.

Complex
The complex data type represents a complex number. It is used for calculations that require a real and an imaginary part. The range of values that can be stored in a complex is typically between -3.4e+38 and 3.4e+38. The complex type is used for scientific calculations, signal processing, and other operations that require complex numbers.

Vector
The vector data type represents a sequence of elements. It is used for storing and manipulating a collection of values. The range of values that can be stored in a vector is typically between 0 and 255 elements. The vector type is used for representing arrays, lists, and other collections of values.

Matrix
The matrix data type represents a two-dimensional array of elements. It is used for storing and manipulating a collection of values in a grid. The range of values that can be stored in a matrix is typically between 0 and 255 elements. The matrix type is used for representing tables, spreadsheets, and other two-dimensional data structures.

Table
The table data type represents a collection of rows and columns. It is used for storing and manipulating data in a structured format. The range of values that can be stored in a table is typically between 0 and 255 rows and 255 columns. The table type is used for representing databases, spreadsheets, and other structured data.

Graph
The graph data type represents a collection of nodes and edges. It is used for storing and manipulating data in a network structure. The range of values that can be stored in a graph is typically between 0 and 255 nodes and 255 edges. The graph type is used for representing networks, social media, and other network structures.
