Bayesian Deep Learning Uncertainty In Deep Learning:

Bayesian Deep Learning and Uncertainty in Computer Vision Buu Truong Phan, 2019 Visual data contains rich information about the operating environment of an intelligent robotic system Extracting this information allows intelligent systems to reason and decide their future actions Erroneous visual information therefore can lead to poor decisions causing accidents and casualties especially in a safety critical application such as automated driving One way to prevent this is by measuring the level of uncertainty in the visual information interpretation so that the system knows the reliability degree of the extracted information Deep neural networks are now being used in many vision tasks due to their superior accuracy compared to traditional machine learning methods However their estimated uncertainties have been shown to be unreliable To mitigate this issue researchers have developed methods and tools to apply Bayesian modeling to deep neural networks This results in a class of models known as Bayesian neural networks whose uncertainty estimates are more reliable and informative In this thesis we make the following contributions in the context of Bayesian Neural Network applied to vision tasks In particular We improve the understanding of visual uncertainty estimates from Bayesian deep models Specifically we study the behavior of Bayesian deep models applied to road scene image segmentation under different factors such as varying weather depth and occlusion levels We show the importance of model calibration technique in the context of autonomous driving which strengthens the reliability of the estimated uncertainty We demonstrate its effectiveness in a simple object localization task We address the high run time cost of the current Bayesian deep learning techniques We develop a distillation technique based on the Dirichlet distribution which allows us to estimate the uncertainties in real time

Fully Bayesian Learning and Classic Deep Learning Elio Abi Younes,2020 Classic deep learning algorithms are powerful tools for the construction of accurate predictive models for labeled data However traditional deep neural networks designed to learning such models are both prone to overfitting and incapable of assessing uncertainty In contrast Bayesian learning based upon the emergence of Markov chain Monte Carlo methods and variational inference provides strong ability to express uncertainty in predictions and improve the estimated posterior probability based on new evidence This work further assesses the efficiency and accuracy of Bayesian inference in complex settings We provide an in depth empirical analysis of the methods on both real and synthetic data in the context of regression and image classification Specifically we develop a unified Bayesian deep neural network model interleaving Bayesian sampling into deep learning By rephrasing these learning techniques upon a common theoretical ground casting 1 the application of fully Bayesian learning for deep neural networks rather than pure optimization based or approximate learning and 2 the most significant regularization technique in neural networks dropout as approximate Bayesian inference we perform a clear comparison proving the efficiency of Bayesian deep learning to maintain state of the art performance compared to existing methods while mitigating the problem of uncertainty in deep learning

Mathematical Analysis of Uncertainty in Machine Learning and Deep Learning Takuya Kashimura,2020 In this paper we study uncertainty in machine learning and deep learning from the mathematical point of view Uncertainty is involved in many real world situations The Bayesian modelling can handle such uncertainty in machine learning community However the traditional deep learning model fails to show uncertainty for its outputs Recently at the intersection of the Bayesian modelling and deep learning a new framework called the Bayesian deep learning BDL has been proposed and studied which enables us to estimate uncertainty of deep learning models As an example of it we can review the results of Yarin Gal in which the famous dropout method can be seen as a Bayesian modelling We also see that overfitting problem of the framework due to the property of the KL divergence and review the modified algorithm using ϕ divergence which generalizes the KL divergence We also study a

confidence band to assess uncertainty of a kernel ridge regression estimator We propose the formulation to obtain a confidence band as the convex optimization which enables us to use existing algorithms such as the primal dual inner point method The proposed method acquires a more accurate and fast confidence band than a bootstrap algorithm We also see the effectiveness of our proposed method both in the case of function approximation and an estimate of an actual dataset

Knowledge Guided Machine Learning Anuj Karpatne, Ramakrishnan Kannan, Vipin Kumar, 2022-08-15

Given their tremendous success in commercial applications, machine learning (ML) models are increasingly being considered as alternatives to science-based models in many disciplines. Yet these black-box ML models have found limited success due to their inability to work well in the presence of limited training data and generalize to unseen scenarios. As a result, there is a growing interest in the scientific community on creating a new generation of methods that integrate scientific knowledge in ML frameworks. This emerging field, called scientific knowledge-guided ML (KGML), seeks a distinct departure from existing data-only or scientific knowledge-only methods to use knowledge and data at an equal footing. Indeed, KGML involves diverse scientific and ML communities where researchers and practitioners from various backgrounds and application domains are continually adding richness to the problem formulations and research methods in this emerging field.

Knowledge Guided Machine Learning: Accelerating Discovery using Scientific Knowledge and Data provides an introduction to this rapidly growing field by discussing some of the common themes of research in KGML using illustrative examples, case studies, and reviews from diverse application domains and research communities as book chapters by leading researchers.

KEY FEATURES: First of its kind book in an emerging area of research that is gaining widespread attention in the scientific and data science fields. Accessible to a broad audience in data science and scientific and engineering fields. Provides a coherent organizational structure to the problem formulations and research methods in the emerging field of KGML using illustrative examples from diverse application domains. Contains chapters by leading researchers which illustrate the cutting edge.

research trends opportunities and challenges in KGML research from multiple perspectives Enables cross pollination of KGML problem formulations and research methods across disciplines Highlights critical gaps that require further investigation by the broader community of researchers and practitioners to realize the full potential of KGML Artificial Intelligence and Machine Learning for Digital Pathology Andreas Holzinger,Randy Goebel,Michael Mengel,Heimo Müller,2020-06-24 Data driven Artificial Intelligence AI and Machine Learning ML in digital pathology radiology and dermatology is very promising In specific cases for example Deep Learning DL even exceeding human performance However in the context of medicine it is important for a human expert to verify the outcome Consequently there is a need for transparency and re traceability of state of the art solutions to make them usable for ethical responsible medical decision support Moreover big data is required for training covering a wide spectrum of a variety of human diseases in different organ systems These data sets must meet top quality and regulatory criteria and must be well annotated for ML at patient sample and image level Here biobanks play a central and future role in providing large collections of high quality well annotated samples and data The main challenges are finding biobanks containing fit for purpose samples providing quality related meta data gaining access to standardized medical data and annotations and mass scanning of whole slides including efficient data management solutions **Developing Deep Learning and Bayesian Deep Learning Based Models for MR**
