

Particles and Quantum

To absorb must be energy... $E_{photon} = h\nu$
 Annihilation - pair of particles and its corresponding antiparticle created and their rest energy is converted into photons

Pair production - when photon turns into a particle and its corresponding antiparticle. The photon must have at least the sum amount of energy which rest energies of particles

Excitation

Exciting means they gain energy through energy to climb their atomic energy levels - $\Delta E = h\nu$
 Alpha particles - Helium nucleus, ${}^4_2\text{He}$
 - highly ionizing, so it is dangerous
 - relatively penetrating - stopped by a piece of paper or foil on their skin
 ${}^{238}_{92}\text{U} \rightarrow {}^{234}_{90}\text{Th} + {}^4_2\text{He}$

Beta - fast moving electron $\rightarrow e^-$
 - medium penetrating and relatively quickly - stopped by a few cm of aluminium
 - fast moving - ${}^{14}_6\text{C} \rightarrow {}^{14}_7\text{N} + e^- + \bar{\nu}_e$ **antiparticle** to avoid type number

Gamma - high energy EM ray or photon emitted from a high energy nucleus $\rightarrow \gamma$
 - highly penetrating - stopped by a few m of concrete

Isotopes - same element - same number of protons
 - different relative atomic mass - different number of neutrons
 ${}^{12}_6\text{C}$ and ${}^{13}_6\text{C}$

Nuclear charge - $\frac{Q}{m}$ [C kg⁻¹]
 - charge to mass ratio

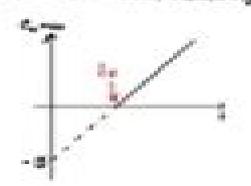

Electron rest - charge of an electron when stationary through a bit of the rest
 - 1.6×10^{-19} C
 - 9.1×10^{-31} kg

Photoelectric effect

Use photons of sufficient energy on electrons on the surface of the metal, liberating them

- $E_{photon} = hf = \phi + E_{kmax}$
- ϕ - photon absorbed - $h\nu$ (work function)
- E_{kmax} - frequency
- ϕ - work function - minimum energy to liberate electrons
- E_{kmax} - kinetic energy that will appear on e^- is liberated
- ϕ - stopped frequency - minimum frequency needed for electrons to be liberated

The photoelectric effect proved the particle nature of light due to the fact that the maximum kinetic energy of electrons E_k is not linearly dependent on the wavelength but is linearly dependent on the frequency of light. Below a certain limit f_0 no electrons are emitted but is constant at f_0 or increases the number of electrons that are emitted per second.

Stopping potential - the pd needed to stop any electrons from reaching the other side

- $E_{kmax} = eV_s$
- E_{kmax} - change in maximum
- V_s - stopping potential

De Broglie

The de Broglie wavelength is the wavelength that a particle can have. The wave nature of a particle was proven by diffraction of a crystal lattice which produces similar groups that propagate across period. This is because the electron is diffracting within the crystal lattice.

- $\lambda = \frac{h}{p}$
- λ - de Broglie wavelength
- p - momentum / mass x velocity

Fluorescent tubes

These tubes contain mercury under a high voltage is applied. This excites the gas molecules to which some of the mercury atoms emit photons when they relax. When the gas relaxes atoms when molecules in mercury atoms, they emit radiation of higher energy than when the electrons relax, say their photons in the UV range. A phosphor coating in the tube absorbs the photons and emit visible light.

Energy levels

Electrons can be excited to higher energy levels. Either by absorbing photons from the light or by the collision. In example below is a gas of atoms colliding when is giving the electron energy.

Ionization energy - is enough energy to pull an electron out of an atom, so will completely change the atom.
