COMPUTATIONAL DESIGN AND AUTOMATION IN STRUCTURAL ENGINEERING: FROM ALGORITHMS TO ARTIFICIAL INTELLIGENCE Jay Dalal ,2025-12-18

Buildings bridges towers dams and other infrastructure systems that allow contemporary civilization to function have their scientific and technical basis in structural engineering which has been an integral part of the built environment for a long time Fundamental to the field is the idea of making sure buildings can withstand all kinds of loads and environmental factors for the whole time they re supposed to be standing Structural engineers have long used simplified analytical techniques and engineering judgment in addition to the basic concepts of mathematics materials science and mechanics Although these principles are still important structural engineers now think about evaluate and build structural systems quite differently due to the fast development of digital technology The advent of digital technology has brought about a sea change from manual rule based processes to fully integrated computation driven workflows which in turn have increased productivity accuracy and creativity Prior to the widespread use of computers structural analysis and design relied heavily on manual computations simplified assumptions and visual aids like charts and design codes Engineers used heuristics based on past experience approximations and closed form analytical solutions to forecast how structures would behave When dealing with large scale systems non linear material behavior dynamic stress or complicated geometries these approaches often imposed constraints despite their effectiveness for conventional structures Over time the limitations of conventional methods were made apparent by the rising need for sustainable infrastructure larger buildings longer span bridges and lightweight constructions
