SUMMARY

Multivariate survival data arise from case–control family studies in which the ages at disease onset for family members may be correlated. In this paper, we consider a multivariate survival model with the marginal hazard function following the proportional hazards model. We use a frailty-based approach in the spirit of Glidden and Self (1999) to account for the correlation of ages at onset among family members. Specifically, we first estimate the baseline hazard function nonparametrically by the innovation theorem, and then obtain maximum pseudolikelihood estimators for the regression and correlation parameters plugging in the baseline hazard function estimator. We establish a connection with a previously proposed generalized estimating equation-based approach. Simulation studies and an analysis of case–control family data of breast cancer illustrate the methodology’s practical utility.

Keywords: Case–control family study; Cox proportional hazards model; Familial aggregation; Frailty model; Innovation theorem.

1. INTRODUCTION

There is an increasing interest in the application of multivariate survival analysis techniques to population-based case–control studies for estimating the marginal hazard function and the dependencies of correlated ages at disease onset (Li *et al.*, 1998; Shih and Chatterjee, 2002; Hsu *et al.*, 2004). An interesting example is a breast cancer study conducted at the Fred Hutchinson Cancer Research Center (Malone *et al.*, 1996). In this study, the breast cancer incidence cases were ascertained from the Surveillance, Epidemiology, and End Results registry, which is a set of geographically defined, population-based cancer registries in the United States. The controls were obtained through random digit dialing and were matched

Analysis of Multivariate Survival Data Philip Hougaard, 2012-12-06 Survival data or more general time to event data occur in many areas including medicine biology engineering economics and demography but previously standard methods have requested that all time variables are univariate and independent This book extends the field by allowing for multivariate times Applications where such data appear are survival of twins survival of married couples and families time to failure of right and left kidney for diabetic patients life history data with time to outbreak of disease complications and death recurrent episodes of diseases and cross over studies with time responses As the field is rather new the concepts and the possible types of data are described in detail and basic aspects of how dependence can appear in such data is discussed Four different approaches to the analysis of such data are presented The multi state models where a life history is described as the subject moving from state to state is the most classical approach The Markov models make up an important special case but it is also described how easily more general models are set up and analyzed Frailty models which are random effects models for survival data made a second approach extending from the most simple shared frailty models which are considered in detail to models with more complicated dependence structures over individuals or over time Marginal modelling has become a popular approach to evaluate the effect of explanatory factors in the presence of dependence but without having specified a statistical model for the dependence Finally the completely non parametric approach to bivariate censored survival data is described This book is aimed at investigators who need to analyze multivariate survival data but due to its focus on the concepts and the modelling aspects it is also useful for persons interested in such data but *Bayesian Hierarchical Models* Peter D. Congdon, 2019-09-16 An intermediate level treatment of Bayesian hierarchical models and their applications this book demonstrates the advantages of a Bayesian approach to data sets involving inferences for collections of related units or variables and in methods where parameters can be treated as random collections Through illustrative data analysis and attention to statistical computing this book facilitates practical implementation of Bayesian hierarchical methods The new edition is a revision of the book *Applied Bayesian Hierarchical Methods* It maintains a focus on applied modelling and data analysis but now using entirely R based Bayesian computing options It has been updated with a new chapter on regression for causal effects and one on computing options and strategies This latter chapter is particularly important due to recent advances in Bayesian computing and estimation including the development of rjags and rstan It also features updates throughout with new examples The examples exploit and illustrate the broader advantages of the R computing environment while allowing readers to explore alternative likelihood assumptions regression structures and assumptions on prior densities Features Provides a comprehensive and accessible overview of applied Bayesian hierarchical modelling Includes many real data examples to illustrate different modelling topics R code based on rjags jagsUI R2OpenBUGS and rstan is integrated into the book emphasizing implementation Software options and coding principles are introduced in new chapter on computing

Methods and Biostatistics in Oncology Raphael. L.C Araújo,Rachel P. Riechelmann,2018-04-16 This book introduces and discusses the most important aspects of clinical research methods and biostatistics for oncologists pursuing a tailor made and practical approach Evidence based medicine EBM has been in vogue in the last few decades particularly in rapidly advancing fields such as oncology This approach has been used to support decision making processes worldwide sparking new clinical research and guidelines on clinical and surgical oncology Clinical oncology research has many peculiarities including specific study endpoints a special focus on survival analyses and a unique perspective on EBM However during medical studies and in general practice these topics are barely taught Moreover even when EBM and clinical cancer research are discussed they are presented in a theoretical fashion mostly focused on formulas and numbers rather than on clinical application for a proper literature appraisal Addressing that gap this book discusses more practical aspects of clinical research and biostatistics in oncology instead of relying only on mathematical formulas and theoretical considerations *Methods and Biostatistics in Oncology* will help readers develop the skills they need to understand the use of research on everyday oncology clinical practice for study design and interpretation as well to demystify the use of EBM in oncology
