MEMS Accelerometers: Testing and Practical Approach for Smart Sensing and Machinery Diagnostics

A. Albarbar and S.H. Teay

Abstract Micro-Electro Mechanical Systems (MEMS)-based sensing elements are gaining wider acceptance and adoption for static and dynamic (mobile) applications. Recent increase in demands for reliable wireless sensing nodes has necessitated seeking alternatives to expensive conventional accelerometers to perform multi-control and monitoring tasks. Owing to their size and cost, MEMS accelerometers is one of the alternative options.

This chapter provides insight into the fundamental design, working principles and practical guidance to MEMS accelerometers. Details of experimental set-ups, signal conditioning and data processing are also provided to construct integrated performance assessment system. Performance assessments are carried out using sinusoidal excitations, impulsive (hammer testing) and random excitations. Subsequently, calculations and comments on frequency response functions, signal-to-noise ratios and phase distortions are outlined. Finally, guidelines to practical adoption of MEMS accelerometers such as packaging, establishing smart vibration sensing nodes and extraction of condition-related information are given.

Keywords MEMS accelerometers design and testing • Performance assessment of MEMS accelerometers • Vibration measurement using MEMS sensors • Smart sensor design and implementation • Machinery-condition monitoring

1 Introduction

Vibration analysis is one of the most usable methods in machinery-condition monitoring. It plays a significant role in the dynamic qualification of newly designed structural components, prediction of faults and structural aging-related problems, and several other structural dynamics studies and diagnosis [1–3]. Handbook of Structural Life Assessment Raouf A. Ibrahim, 2017-04-17. This important self-contained reference deals with structural life assessment (SLA) and structural health monitoring (SHM) in a combined form. SLA periodically evaluates the state and condition of a structural system and provides recommendations for possible maintenance actions or the end of structural service life. It is a diversified field and relies on the theories of fracture mechanics, fatigue damage process and reliability theory. For common structures, their life assessment is not only governed by the theory of fracture mechanics and fatigue damage process but by other factors such as corrosion, grounding and sudden collision. On the other hand, SHM deals with the detection, prediction and location of crack development online. Both SLA and SHM are combined in a unified and coherent treatment.

MEMS Accelerometer Specifications and Their Impact in Inertial Applications Kei-Ming Kwong,2017 Recent development of microelectromechanical systems MEMS accelerometers improved their performance Coupled with their benefits of lower cost and smaller size enabled their increased utilization in navigation automotive and

consumer devices. However, specification and testing methodologies of these devices are not robustly defined. This work investigates and defines a set of testing methodology for MEMS accelerometers making use of a 3D printer based testing platform and a scalable inertial sensor testing board. Specification results show that Kionix KXRB5 and Invensense MPU6000 perform the best of the devices tested. Furthermore, commonly used inertial algorithms were applied to study the impact of accelerometer choice in an inertial navigation system (INS). Across attitude estimation and dead reckoning tests, results indicate that noise density has little impact on performance after inertial algorithms are applied. Cross-axis bias variability and step motion specification results are better indicators of performance after inertial algorithms are applied.
