Young, 2019-10-24 Performance of the Jet Transport Airplane Analysis Methods Flight Operations and Regulations presents a detailed and comprehensive treatment of performance analysis techniques for jet transport airplanes. Uniquely the book describes key operational and regulatory procedures and constraints that directly impact the performance of commercial airliners. Topics include rigid body dynamics, aerodynamic fundamentals, atmospheric models including standard and non standard atmospheres, height scales and altimetry, distance and speed measurement, lift and drag and associated mathematical models, jet engine performance including thrust and specific fuel consumption models, takeoff and landing performance with airfield and operational constraints, takeoff climb and obstacle clearance, level climbing and descending flight including accelerated climb, descent, cruise and range including solutions by numerical integration, payload, range, endurance and holding, maneuvering flight including turning and pitching maneuvers, total energy concepts, trip fuel planning and estimation including regulatory fuel reserves en route operations and limitations, e.g. climb speed, schedules, cruise ceiling, ETOPS, cost considerations, e.g. cost index, energy cost, fuel tankering, weight balance and trim, flight envelopes and limitations including stall and buffet onset speeds, V_n diagrams, environmental considerations, viz. noise and emissions, aircraft systems and airplane performance, e.g. cabin pressurization, de-icing and fuel and performance related regulatory requirements of the FAA Federal Aviation Administration and EASA European Aviation Safety Agency. Key features: Describes methods for the analysis of the performance of jet transport airplanes during all phases of flight. Presents both analytical closed form methods and numerical approaches. Describes key FAA and EASA regulations that impact airplane performance. Presents equations and examples in both SI System International and USC United States Customary

units Considers the influence of operational procedures and their impact on airplane performance Performance of the Jet Transport Airplane Analysis Methods Flight Operations and Regulations provides a comprehensive treatment of the performance of modern jet transport airplanes in an operational context It is a must have reference for aerospace engineering students applied researchers conducting performance related studies and flight operations engineers

Polarity-Dependent Removal Interferences in Sink EDM of Titanium Alloys Maximilian Holsten,2018-12-31 In the design of turbomachinery components a significant effort is carried out regarding the optimization of efficiency The increase in thermal efficiency particularly involves the introduction of high performance alloys Such alloys are for example titanium alloys Sink electrical discharge machining sink EDM is a crucial manufacturing process for components due to its independence of machined material strengths however new materials require process design Hence research to understand and optimize the machining of titanium alloys is of great benefit to the industry in general A positive tool polarity is generally adopted in sink EDM to maximize material removal relative to tool wear Sink EDM of titanium alloys as Ti6Al4V is however atypical in that these materials necessitate a negative tool polarity Adding to the intrigue are gamma titanium aluminides TiAl which machine better under the conventional positive polarity Established explanatory models of sink EDM fail in resolving the removal behavior a need for fundamental research is given This thesis focuses on clarifying the phenomena behind this interesting behavior by investigating removal mechanisms over a range of relevant process conditions The polarity effect is demonstrated to arise from the polarity dependent nature and extent of titanium carbide TiC formation on the workpiece surface which significantly affects material removal mechanisms An explanatory model deduced from different experimental and numerical approaches clarifies the influence of polarity to the formation mechanism of a TiC layer With regard to monitoring of adverse layer formations the measurement of acoustic emission AE is proven an appropriate concept A correlation of the AE signal to process forces is even established which may be crucial to determine the deflection of thin electrodes in EDM Finally the knowledge acquired is applied and enhanced in comprehensive process design that also involves the machining of additively manufactured TiAl The study reveals the beneficial behavior of the fine microstructure relative to the resulting surface integrity As a result this thesis delivers a model based concept for process design with respect to the adequate choice of tool polarity during machining of titanium alloys **Aircraft Propulsion** Saeed
