Earthquake Spectra ,1984 *Proceedings of the Canadian Society for Civil Engineering Annual Conference 2024, Volume 13* Ehab Elsalakawy,Ahmed Elshaer,Ayman El Ansary,2025-10-03 This book comprises the proceedings of the Annual Conference of the Canadian Society of Civil Engineering 2024 The contents of this volume focus on specialty conferences in structural engineering This volume will prove a valuable resource for those in academia and industry Scientific and Technical Books and Serials in Print ,1984 **PCI Journal** ,2005 **Analytical Development of Capacity Design Factors for a Precast Concrete Diaphragm Seismic Design Methodology** Ge Wan,2008 The primary objective of the dissertation work is to examine the capacity of precast concrete diaphragms This work is part of a multi university research effort to develop a new seismic design methodology for precast prestressed concrete floor diaphragms To accomplish this two dimensional finite element FE models of precast floor diaphragms are created including new elements to match the response of reinforcing details under combined forces Using these models nonlinear staticpushoveranalyses are performed by applying body forces in the plane of the floor The analyses are composed of three major parts 1 Parametric studies to determine the required diaphragm shear strength relative to design flexural strength termedshear reinforcement overstrength to promote a ductile mechanism in precast diaphragms The performance of precast diaphragms with different shear reinforcement overstrength is examined Appropriate shear reinforcement overstrength design factors are proposed to produce certain performance targets in terms of a number of key parameters related to diaphragm geometry and the properties of the diaphragm reinforcing details 2 Parametric studies to examine the effects ofsecondarydiaphragm elements spandrels internal beams on precast diaphragm behavior Though not directly counted in design to participate diaphragm action the secondary elements and their connections to the main diaphragm may modify the strength stiffness and deformation capacity of the diaphragm Analytical studies are performed to examine their effect on the global characteristics and local demands of precast floor diaphragms The parameters evaluated include the characteristics of the connection

details the seismic hazard level used in design diaphragm geometry and layouts of spandrels and internal beams 3
Development of a rational method for calculating the service stiffness and yield strength of precast concrete diaphragms The method involves input of diaphragm geometry and reinforcing details The method is verified analytically through comparisons to a set of FE analyses for an idealized diaphragm representation regular single span diaphragm idealized with simple end supports The method verified for a single set of diaphragm reinforcement details is used to estimate the properties over a range of untopped and topped diaphragm systems Consideration of spandrel and internal beams in the method is discussed

Inelastic Seismic Response of Reinforced Concrete Buildings with Floor Diaphragm Openings Mohamed T. Al Harash, 2011 Floor and roof systems are designed to carry gravity loads and transfer these loads to supporting beams columns or walls Furthermore they play a key role in distributing earthquake induced loads to the lateral load resisting systems by diaphragm action In reinforced concrete buildings the in plane flexibility of the floor diaphragms is often ignored for simplicity in practical design i e the floor systems are frequently treated as perfectly rigid diaphragms In recent building standards ASCE 7 2005 it is acknowledged that this assumption can result in considerable errors when predicting the seismic response of reinforced concrete buildings with diaphragm plan aspect ratio of 3 1 or greater However the influence of floor diaphragm openings typically for the purpose of stairways shafts or other architectural features has not been considered In order to investigate the influence of diaphragm openings on the seismic response of reinforced concrete buildings several 3 story reinforced concrete buildings are designed as a Building Frame System according to the International Building Code 2006 Each building is assumed to be in the Saint Louis Missouri area and it s analyzed using IDARC2 a non commercial program capable of conducting nonlinear analysis of RC buildings with rigid elastic or inelastic floor diaphragms under both static lateral loads pushover and dynamic ground motions time history where a suite of three well known earthquakes is scaled to model moderate ground motions in the Saint Louis region The comprehensive analytical study conducted involves placing different opening sizes none 11% 15% and 22% of total floor area in various floor plan locations with respect to the location of the shear walls located at end frames or at the interior frames where three types of floor diaphragm models rigid elastic and inelastic are assumed Building floor plan aspect ratios of 3 1 and 4 1 are investigated IDARC2 is enhanced by modifying the fiber model strain compatibility computation routine involved in obtaining the idealized moment curvature curves of floor slabs with openings symmetric and nonsymmetric Also a new option is added so that the user can over ride IDARC2 idealized moment curvature curves for slabs with openings and by defining their own The results are then presented and discussed It is concluded that in order to capture the seismic response of reinforced concrete buildings with floor diaphragm openings accurately it is necessary to use an inelastic diaphragm model for floor diaphragm aspect ratio of 3 1 or greater Thus using a rigid diaphragm assumption as specified by ASCE7 05 for buildings concrete floor diaphragms with aspect ratio of 3 1 and elastic diaphragm assumption as allowed by ASCE7 05 for floor diaphragm with aspect ratio of 4 1 can

result in significant underestimations of the lateral loads resisted by the interior building frames and building maximum frame displacements particularly when the diaphragm openings are located in the middle two thirds of the building plan The base shear redistribution due to inelastic slab deformations increases the load subjected to the interior frames significantly Hence the influence of inelastic inplane diaphragm deformations due to floor openings cannot be overlooked in such buildings Simple design recommendation is given for determining proper diaphragm chord reinforcement to prevent in plane floor slab yielding when openings are present
