Lotus Pro 2.52

Introduction

Database management systems (DBMS) are software systems that allow users to store, retrieve, and manage data. They provide a structured way to organize information and ensure its integrity and security.

Key Concepts

- Data:** Information that is organized and stored in a structured manner.
- Database:** A collection of related data organized in a way that allows for easy access, retrieval, and modification.
- Table:** A collection of related data organized in rows and columns.
- Primary Key:** A unique identifier for each record in a table.
- Foreign Key:** A field in one table that refers to the primary key of another table.
- Relationship:** A connection between two or more tables based on common fields.

Database Design

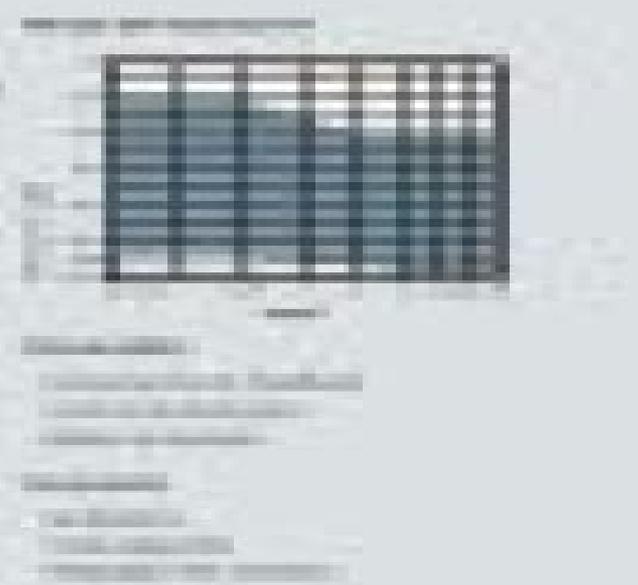

The process of creating a database structure that meets the requirements of a specific application. It involves defining the data to be stored, the relationships between the data, and the access methods.

Normalization

A process of organizing data into tables to minimize redundancy and improve data integrity. It involves breaking down large tables into smaller, related tables and defining relationships between them.

Query Languages

Tools used to interact with a database, including SQL (Structured Query Language) for data manipulation and retrieval, and DDL (Data Definition Language) for defining the database structure.
