### Identifying Polymers, Solids, Metals, and Liquids

#### Rank of Crystalline Compounds

When crystalline polymers are subjected to stress, they will undergo a phase transition and exhibit a change in their physical properties. This is known as the glass transition. The glass transition is a first-order transition, and it is characterized by a change in the heat capacity of the material. The glass transition is a function of the rate of cooling, and it is also affected by the presence of plasticizers. The glass transition is a function of the molecular weight of the polymer, and it is also affected by the presence of crosslinks. The glass transition is a function of the crystallinity of the polymer, and it is also affected by the presence of defects.
