Least-Squares Finite Element Formulation for Fluid-Structure Interaction CODY C. RASMUSSEN,2025-05-22

Fluid structure interaction problems prove difficult due to the coupling between fluid and solid behavior Typically different theoretical formulations and numerical methods are used to solve fluid and structural problems separately The leastsquares finite element method is capable of accurately solving both fluid and structural problems This capability allows for a simultaneously coupled fluid structure interaction formulation using a single variational approach to solve complex and nonlinear aeroelasticity problems The least squares finite element method was compared to commonly used methods for both structures and fluids individually The fluid analysis was compared to finite differencing methods and the structural analysis type compared to traditional Weak Galerkin finite element methods The simultaneous solution method was then applied to aeroelasticity problems with a known solution Achieving these results required unique iterative methods to balance each domain s or differential equation s weighting factor within the simultaneous solution scheme The scheme required more computational time but it did provide the first hands off method capable of solving complex fluid structure interaction problems using a simultaneous least squares formulation A sequential scheme was also examined for coupled problems This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it This work was reproduced from the original artifact and remains as true to the original work as possible Therefore you will see the original copyright references library stamps as most of these works have been housed in our most important libraries around the world and other notations in the work This work is in the public domain in the United States of America and possibly other nations Within the United States you may freely copy and distribute this work as no entity individual or corporate has a copyright on the body of the work As a reproduction of a historical artifact this work may contain missing or blurred pages poor pictures errant marks etc Scholars believe and we concur that this work is important enough to be preserved reproduced and made generally available to the public We appreciate your support of the preservation process and thank you for being an important part of keeping this knowledge alive and relevant Fluid-structure Interaction Analysis with the Particle Finite Element Method Minjie Zhu,2014 To facilitate the evaluation and design of structures subjected to fluid loading a study of fluid structure interaction FSI using the particle finite element method PFEM is presented to approximate the responses and sensitivities of structures which interact with fluid A wide range of structural types are permissible by making no assumptions of the configurations materials or any properties of the structures On the other hand the Newtonian flows are assumed which are sufficient for the fluid that interacts with structures such as bridges coastal

buildings and off shore structures The particle finite element method is used here as the primary tool for numerical computation with two advantages First both fluid and structural domains are described with Lagrangian formulation in PFEM which conform to the traditional formulation for structural mechanics Therefore the interaction and coupling of both domains can be naturally described at level of differential equations Second the PFEM is a particle based method where particles are moved by their own mass and interaction between connected particles This is convenient to free surface problems which is common in most of our applications In order to accommodate arbitrary structures in PFEM the fractional step method FSM used in the original PFEM is modified with better accuracy and convergence rate An unified FSM is also proposed for fluid with high viscosity and fluid elements with consistent mass matrix The MINI element is used in this study as replacement of the stabilized linear element to eliminate the additional unknowns in the original PFEM As a prerequisite to the reliability based structural design the sensitivity analysis of PFEM is studied using the direct differentiation method DDM The large displacement of the fluid domain is considered in forming the sensitivity equations of FSI by introducing the additional geometric sensitivity The structural finite element software OpenSees is chosen as the platform for implementation It is extended by adding new modules at high and low levels of the software framework Numerical results computed by OpenSees using PFEM are compared to analytical solutions experimental data and results from other numerical methods which are shown from Chapter 2 to 5
