

Designation: E83 – 23

## Standard Practice for Verification and Classification of Extensometer Systems<sup>1</sup>

This standard is issued under the fixed designation E83; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last approval. A superscripted epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or approval.

This standard has been approved for use by agencies of the U.S. Department of Defense.

### 1. Scope<sup>2</sup>

1.1 This practice covers procedures for the verification and classification of extensometer systems, but it is not intended to be a complete purchase specification. The practice is applicable only to instruments that indicate or record values that are proportional to changes in length corresponding to either tensile or compressive strain. Extensometer systems are classified on the basis of the magnitude of their errors.

1.2 Because strain is a dimensionless quantity, this document can be used for extensometers based on either SI or US customary units of displacement.

**Note 1**—Bonded resistance strain gauges directly bonded to a specimen cannot be calibrated or verified with the apparatus described in this practice for the verification of extensometers having definite gauge points. (See procedures as described in Test Methods E251.)

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use.

1.4 This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

### 3. Terminology

#### 3.1 Definition:

3.1.1 In addition to the terms listed, see Terminology E6.

3.1.2 *calibration*—a determination of the calibration factor for a system using established procedures.

3.1.3 *calibration factor*—the factor by which the change in extensometer reading must be multiplied to obtain the equivalent strain.

3.1.3.1 *Discussion*—For any extensometer, the calibration factor is equal to the ratio of change in length to the product of the gauge length and the change in the extensometer reading. For direct-reading extensometers the calibration factor is unity.

3.1.4 *compressometer*—a specialized extensometer used for sensing negative or compressive strain.

3.1.5 *deflectometer*—a specialized extensometer used for sensing of extension or motion, usually without reference to a specific gauge length.

3.1.6 *displacement tracking optical extensometer system (DOT)*, *n*—an optical extensometer system that uses marks at an initially known distance, physically placed on a specimen or calibration fixture, to establish the gauge length value for determination of strain.

3.1.7 *error, in extensometer systems*—the value obtained by subtracting the correct value of the strain from the indicated value given by the extensometer system.

3.1.8 *extensometer, n*—a device for sensing strain.

3.1.9 *extensometer system*—a system for sensing and indicating strain.

3.1.9.1 *Discussion*—The system will normally include an extensometer, conditioning electronics and auxiliary device
