$c_j - z_j$		12	18	10	0	0	0		

- Iteration 1

- Step 1: Determine the Entering Variable

The most positive $c_j - z_j = 18$. Thus x_2 is the entering variable.

The Simplex Method Karl Heinz Borgwardt, 2012-12-06 For more than 35 years now George B Dantzig's Simplex Method has been the most efficient mathematical tool for solving linear programming problems It is probably that mathematical algorithm for which the most computation time on computers is spent This fact explains the great interest of experts and of the public to understand the method and its efficiency But there are linear programming problems which will not be solved by a given variant of the Simplex Method in an acceptable time The discrepancy between this negative theoretical result and the good practical behaviour of the method has caused a great fascination for many years While the worst case analysis of some variants of the method shows that this is not a good algorithm in the usual sense of complexity theory it seems to be useful to apply other criteria for a judgement concerning the quality of the algorithm One of these criteria is the average computation time which amounts to an analysis of the average number of elementary arithmetic computations and of the number of pivot steps A rigid analysis of the average behaviour may be very helpful for the decision which algorithm and which variant shall be used in practical applications The subject and purpose of this book is to explain the great efficiency in practice by assuming certain distributions on the real world problems Other stochastic models are realistic as well and so this analysis should be considered as one of many possibilities

Tarantola,1987-04 Inverse Problem Theory is written for physicists geophysicists and all scientists facing the problem of quantitative interpretation of experimental data Although it contains a lot of mathematics it is not intended as a mathematical book but rather tries to explain how a method of acquisition of information can be applied to the actual world The book provides a comprehensive up to date description of the methods to be used for fitting experimental data or to estimate model parameters and to unify these methods into the Inverse Problem Theory The first part of the book deals with discrete problems and describes Maximum likelihood Monte Carlo Least squares and Least absolute values methods The second part deals with inverse problems involving functions The book is almost completely self contained with all important concepts carefully introduced Although theoretical concepts are strongly emphasized the author has ensured that all the useful formulas are listed with many special cases included The book will thus serve equally well as a reference manual for researchers needing to refresh their memories on a given algorithm or as a textbook in a course for undergraduate or graduate students **International Journal of Applied Mathematics** ,2004
