*Single-Stage Dual-Phase-Shift DAB AC-DC Converter Based on GaN Transistor* Tianxiang CHEN,2017 *Three-level Soft-switched DC-to-DC Converter and Single-phase, Single-stage, Three-level AC-to-DC Converter* Vimala Dharmarajan,2006

**Dynamic Carrier Pulse-positioning for Single-stage Isolated AC-DC Converter** Ambegoda Liyanage Vishwa Perera,2022 The transportation sector is gaining much more attention towards all electric modes such as electric vehicles EV and more electric aircrafts and ships EVs lead the transportation sector with luxurious high performance and intelligent vehicles The stored battery energy is the most important factor for the operation of the whole vehicle and therefore EV battery chargers play an important role in the electric transportation sector High frequency isolated battery charger converters are much preferred in the industry as they provide electrical isolation and reduce magnetic component size Phase shifted pulse width modulation is commonly used in transformer isolated converters for high frequency power transfer Generally the voltage waveforms are phase shifted no more than 45 degrees for grid connected converter applications In grid connected applications the high frequency pulse widths 180 to minimum determined by modulation index may vary when controlling the grid current If for certain duration of the low frequency reference signal the pulse widths are smaller than the externally

commanded phase shift the pulses would be completely separated Under these conditions unwanted reactive content is generated in the converter increasing the high frequency rms current hence increasing conduction losses An original concept is proposed to lower the reactive content of the high frequency current by positioning the transformer primary and secondary voltage pulses next to each other whenever the phase shift is larger than the pulse width The voltage pulses are positioned appropriately in each carrier cycle throughout the entire low frequency reference signal This concept which is referred to as reference based pulse position RPP allows the operation of the converter beyond 45 degree limit and up to 90 degrees allowing for more power output The concept is tested on an isolated single stage bidirectional three phase ac dc converter which conducts both low frequency grid current and high frequency transformer current The grid side or the primary of the converter generates the high frequency transformer voltage when controlling the grid current The switches in the secondary side are then controlled in such a way in each carrier cycle as to coordinate with primary voltage waveform to minimize the reactive content of the high frequency current The power is transferred utilizing the transformer interlimb leakage inductance The transformer windings are connected so that the 60Hz grid current does not produce flux in the core leaving only the high frequency flux Therefore the size of the magnetics can be reduced which favors a compact design Furthermore the dc link utilization is maximized by injecting the third harmonic into the sine reference signals which lowers the dc link requirement by 15%

**Design and Implementation of a Bidirectional Phase-Shift Full-Bridge DC-DC Converter with Clamp Circuits** □□□,2017      **High-Frequency Isolated Bidirectional Dual Active Bridge DC-DC Converters with Wide Voltage Gain** Deshang Sha,Guo Xu,2018-05-17 Written by experts this book is based on recent research findings in high frequency isolated bidirectional DC DC converters with wide voltage range It presents advanced power control methods and new isolated bidirectional DC DC topologies to improve the performance of isolated bidirectional converters Providing valuable insights advanced methods and practical design guides on the DC DC conversion that can be considered in applications such as microgrid bidirectional EV chargers and solid state transformers it is a valuable resource for researchers scientists and engineers in the field of isolated bidirectional DC DC converters      [DC-DC Converter Topologies](#) Gerry Moschopoulos,2023-12-18 DC DC Converter Topologies A comprehensive look at DC DC converters and advanced power converter topologies for all skills levels As it can be rare for source voltage to meet the requirements of a Direct Current DC load DC DC converters are essential to access service DC DC power converters employ power semiconductor devices like MOSFETs and IGBTs as switches and passive elements such as capacitors inductors and transformers to alter the voltage provided by a DC source into the necessary DC voltage as is required by a DC load This source can be a battery solar panels fuel cells or a DC bus voltage fed by rectified AC utility voltage As the many components of DC DC converters can be differently arranged into circuit structures called topologies there are as many possible circuit topologies as there are possible combinations of circuit elements Focusing on DC DC switch mode power converters ranging from 50 W to 10kW DC

DC Converter Topologies provides a survey of all converter topology types within this power range. General principles are described for each topology type using a representative converter as an example. Variations that can be found that differ from the example are then examined with a helpful discussion of comparisons when relevant. A broad range of topics is covered within the book from simple low power converters to complex high power converters and everywhere in between. DC DC Converter Topologies readers will also find a detailed discussion of four key DC DC converter topologies: Description of isolated two switch pulse width modulated PWM topologies including push pull half bridge and interleaved converters. An exploration of high gain converters such as coupled inductors voltage multipliers and switched capacitor converters. This book provides the tools so that a non expert will be equipped to deal with the vast array of DC DC converters that presently exist. As such DC DC Converter Topologies is a useful reference for electrical engineers, professors and graduate students studying in the field.

**AC to AC Converters** Narayanaswamy P R Iyer, 2019-06-03. Power electronic converters can be broadly classified as AC to DC, DC to AC, DC to DC and AC to AC converters. AC to AC converters can be further classified as AC Controllers or AC regulators, Cycloconverters and Matrix converters. AC controllers and cycloconverters are fabricated using Silicon Controlled Rectifiers (SCR) whereas matrix converters are built using semiconductor bidirectional switches. Haider Neamah Hashim Almahmoodi,2018 Rising worldwide demand for energy pressing economic constraints and substantial environmental concerns have led to the harvesting of clean renewable energy sources such as solar PV and wind energy To integrate these new resources into the power grid power electronic converters play a crucial role and have become indispensable devices Multilevel converters are considered to be state of the art efficient solutions for medium and high voltage industrial applications due to the difficulty of connecting traditional two level converters to high and medium voltage grids since the single power switch cannot stand such high voltage The standard multilevel converter topologies such as the neutral point clamped NPC flying capacitor multilevel FCM and cascaded H bridge CHB are currently used however the need for higher efficiency multilevel topologies that require the lowest number of components These benefits make the proposed The cascade H bridge multilevel converter topology has been the preferred solution over other standard multilevel converter topologies because each level has the same structure with no extra clamping diodes or capacitors Therefore this study proposes a CHB converter with a new structure that requires fewer number of the insulated gate bipolar transistors IGBTs for generating AC voltage at the output stage of the converter using a modified phase shift pulse width modulation PWM control system The reduction in the number of required IGBTs will decrease the converter cost size and installation area while also improving its reliability These benefits make the proposed topology a good candidate for renewable energy applications especially for photovoltaic integration The ability of the proposed inverter to generate the desired output voltage waveform has been validated through a laboratory low power prototype A comparative analysis with the other typologies is provided which supports the capability of the proposed topology for reducing the number of high frequency IGBTs and isolated DC link Since one of the most commonly and extensively used converter topologies in power electronics are rectifiers a grid connected active front end AFE rectifier based on the suggested reduced switch count CHB converter family is also proposed The bidirectional capabilities of the proposed multilevel converter verified through simulation and operation in the inverting and rectifying modes It was shown that the propose typology is able to inject the commanded active and reactive power into the grid in addition to the abilities to absorb power from the grid The voltage oriented control VOC method has been implemented on the grid tied bidirectional multilevel converter and simulation results verify the benefits of the new typology The proposed converter modulated with the selective harmonic elimination method SHEM has inherited complexity due to the set of nonlinear equations derived to determine the switching angles for the CHB converter with different modulation indices voltage levels and various harmonics selected for elimination Therefore a generalized solution to address total harmonic distortion THD is also proposed     **Phase Shifted Bridge Converter for a High Voltage Application**
