ABSTRACT This paper proposes a new observer-based model-free adaptive sliding mode predictive control method (MFASPC) for discrete-time nonlinear systems. This scheme first equates the discrete-time nonlinear system to a linear form using a data-driven compact form dynamic linearization (CFDL) technique, establishes a data model consisting of only the pseudo partial derivatives (PPD), input data and output data, designs adaptive observers to achieve the estimation of the unknown PPD. The controller design part uses integral sliding mode control (SMC) to ensure the system's robustness. In contrast, with its constraint characteristics, the model predictive control (MPC) replaces the traditional switching control of SMC. The closed-loop control quantities are obtained by solving a rolling optimization problem in the finite time domain to provide dynamic optimal control action. The theoretical derivation of the Lyapunov function is used to demonstrate the system's stability. In order to verify the effectiveness of the proposed algorithm, numerical simulations and Photovoltaic power generation system simulation experiments are conducted, respectively, and the results show that the proposed control algorithm has a very reliable tracking capability and control accuracy.

I. INTRODUCTION

IN recent years, adaptive control techniques for nonlinear systems have attracted a large number of scholars and much effort has been devoted to them [1]–[3]. However, most methods require dynamical or mechanistic analysis of the control system to obtain an accurate mathematical model first, and there are inevitably approximation links throughout the process [4]. In contrast, the ignored unmodeled dynamics part may be a potential factor that makes the closed-loop system unstable and reduces the controller performance.

Model-free adaptive control (MFAC) is a data-driven control method for discrete-time nonlinear systems to improve modeling difficulties [5], and its most important features compared to other data-driven control methods are the equivalent dynamic linearization process and the introduction of virtual parameters (PPD). MFAC uses the input and output data of the system to update the

virtual parameters online dynamically, thus establishing an equivalent data model, both the PPD and the data model, which depend merely on the data and are unrelated to the structural information of the system, thus thoroughly characterizing the nonlinear and uncertain features of the system [6]. It has been widely used in the past few years, such as urban traffic control, heading control, zero-sum game control, flexible joint control, etc. [7]–[10].

As the research progresses, to further solve the uncertainty problem of the control system and ensure robust performance in control, some scholars bring the SMC into the MFAC algorithm to carry out the research, which produces the model-free adaptive sliding mode control (MFASMC) scheme. Among them, the sliding phase of the SMC law ensures the excellent stability performance of the system, and the arrival phase determines the system's dynamic performance. For example, [11]

Model Predictive Control with Fault Detection and Diagnosis for Multivariable Systems Vinayak Deshpande,2022 The feedback control system design technique of Model Predictive Control MPC has been vastly used in the chemical and process engineering industry due to its ability to handle dynamics with multiple inputs and multiple outputs which are essentially the majority of today s engineering systems In addition the field of Fault Detection and Diagnosis FDD in control systems also has been extensively researched over the past decades as it is critical for the controller to realize when and if a fault has occurred within a system However due to the high computational requirements it is often challenging to implement FDD based MPC algorithms in resource limited real world systems This thesis addresses the development of MPC algorithms with combined state and fault estimation Firstly a novel Quadratic Programming QP formulation is developed for a recently proposed efficient MPC method along with simultaneous state and fault estimation Another contribution is the enhancement of a standard integral action MPC algorithm which has an implicit fault tolerance capability to provide state and actuator fault estimation in real time This work focuses on faults which are modeled as a Loss Of Effectiveness LOE The algorithm to estimate the system faults and states simultaneously is a simple observer based method which can be tuned beforehand thus eliminating the need for on line real time complex calculations Lastly a third contribution of this thesis is the application of the above methods to design MPC based flight control systems for fixed wing aircraft Simulations are presented to demonstrate the effectiveness of the proposed methods

Control Bianca Lupei, 2016 Model predictive control is an advanced method of process control that has been in use in the process industries in chemical plants and oil refineries since the 1980s. In recent years it has also been used in power system balancing models. Model predictive controllers rely on dynamic models of the process, most often linear empirical models obtained by system identification. The main advantage of model predictive control is the fact that it allows the current timeslot to be optimized while keeping future timeslots in account. This is achieved by optimizing a finite time horizon but only implementing the current timeslot. Model predictive control has the ability to anticipate future events and can take control actions accordingly. MPC models predict the change in the dependent variables of the modelled system that will be caused by changes in the independent variables. In a chemical process, independent variables that can be adjusted by the controller are often either the setpoints of regulatory PID controllers or the final control element. Independent variables that cannot be adjusted by the controller are used as disturbances. Dependent variables in these processes are other measurements that represent either control objectives or process constraints. The book entitled *Advanced Model Predictive Control* is intended to present the reader the recent achievements in this field. The book also delivers applications of MPC in modern industry and effective commercial software for MPC is familiarized.
