Benchmark 4 F Exponential Functions:

Benchmarking as a Foundation of the Future Economy Berezin Artiom Andreevich, 2020-09-02 This book explores how to increase the efficiency of decision making for enterprise management and increase its competitiveness based on mathematical modeling of the benchmarking process predictive modeling of the dynamics of economic performance indicators and the synthesis and selection of development strategies using software tools It argues that instead of mutually devouring competition which is common in the modern world the model of friendly cooperative benchmarking on the principle of win win is proposed for consideration The advantage of this principle over the classic competitiveness one is proved through mathematical modeling and implementation of this approach in the activities of real companies banks and industrial enterprises

Extension of Latin Hypercube Samples with Correlated Variables William L. Oberkampf, Timothy Guy Trucano, 2007 Verification and validation V V are the primary means to assess the accuracy and reliability of computational simulations V V methods and procedures have fundamentally improved the credibility of simulations in several high consequence fields such as nuclear reactor safety underground nuclear waste storage and nuclear weapon safety Although the terminology is not uniform across engineering disciplines code verification deals with assessing the reliability of the software coding and solution verification deals with assessing the numerical accuracy of the solution to a computational model Validation addresses the physics modeling accuracy of a computational simulation by comparing the computational results with experimental data Code verification benchmarks and validation benchmarks have been constructed for a number of years in every field of computational simulation However no comprehensive guidelines have been proposed for the construction and use of V V benchmarks For example the field of nuclear reactor safety has not focused on code verification benchmarks but it has placed great emphasis on developing validation benchmarks Many of these validation benchmarks are closely related to the operations of actual reactors at near safety critical conditions as opposed to being more fundamental physics benchmarks This paper presents recommendations for the effective design and

use of code verification benchmarks based on manufactured solutions classical analytical solutions and highly accurate numerical solutions In addition this paper presents recommendations for the design and use of validation benchmarks highlighting the careful design of building block experiments the estimation of experimental measurement uncertainty for both inputs and outputs to the code validation metrics and the role of model calibration in validation It is argued that the understanding of predictive capability of a computational model is built on the level of achievement in V V activities how closely related the V V benchmarks are to the actual application of interest and the quantification of uncertainties related to the application of interest

Proceedings of the 1994 Topical Meeting on Advances in Reactor Physics, 1994 *CPU Performance Evaluation and Execution Time Prediction Using Narrow Spectrum Benchmarking* University of California, Berkeley. Computer Science Division, Rafael H. Saavedra-Barrera, 1992 We have developed tools to measure the performance of a variety of machines from workstations to supercomputers We have also characterized the execution of many large applications including the SPEC and Perfect benchmark suites By merging these machine and program characterizations we can estimate execution times quite accurately for arbitrary machine program combinations Another aspect of the research has consisted in characterizing the effectiveness of optimizing compilers Another contribution of this dissertation is to propose and investigate new metrics for machine and program similarity and the information that can be derived from them
