Guidelines for Surveying Soil and Land Resources NJ McKenzie, MJ Grundy, R Webster, AJ Ringrose-Voase, 2008-04-07

Guidelines for Surveying Soil and Land Resources promotes the development and implementation of consistent methods and standards for conducting soil and land resource surveys in Australia. These surveys are primarily field operations that aim to identify, describe, map, and evaluate the various kinds of soil or land resources in specific areas. The advent of geographic information systems, global positioning systems, airborne gamma radiometric remote sensing, digital terrain analysis, simulation, modelling, efficient statistical analysis, and internet-based delivery of information has dramatically changed the scene in the past two decades. As successor to the Australian Soil and Land Survey Handbook Guidelines for Conducting Surveys, this authoritative guide incorporates these new methods and techniques for supporting natural resource management. Soil and land resource surveyors, engineering and environmental consultants, commissioners of surveys, and funding agencies will benefit from the practical information provided on how best to use the new technologies that have been developed, as will professionals in the spatial sciences such as geomorphology, ecology, and hydrology. Civil Engineering Applications of Ground Penetrating Radar Andrea Benedetto, Lara Pajewski, 2015-04-07. This book, based on Transport and Urban Development COST Action TU1208, presents the most advanced applications of ground penetrating radar (GPR) in a civil engineering context, with documentation of instrumentation methods and results. It explains clearly how GPR can be employed for the surveying of critical transport infrastructure such as roads, pavements, bridges, and tunnels, and for the sensing and mapping of underground utilities and voids. Detailed attention is also devoted to use of GPR in the inspection of geological structures and of construction materials and structures, including reinforced concrete, steel reinforcing bars, and pre-stressed stressing ducts. Advanced methods for solution of electromagnetic scattering problems and new data processing techniques are also presented. Readers will come to appreciate that GPR is a safe, advanced, non-destructive, and non-invasive imaging technique that can be effectively used for the inspection of composite structures and the performance of diagnostics relevant to the entire life cycle of civil engineering works. **Use of Surface and Borehole Ground**

Penetrating Radar in Geologic and Engineering Investigations of Transportation Projects Georgios P. Tsoflias, 2010

This project investigates the use of ground penetrating radar (GPR) subsurface imaging in transportation projects. Knowledge of shallow subsurface geologic conditions is critical to planning, constructing, and maintaining transportation infrastructure such as roads, bridges, tunnels, and railroads. Transportation projects rely heavily on drilled boreholes for characterization of subsurface geology. A borehole provides accurate information at a single location; one-dimensional and several test borings are commonly required in order to determine the lateral extent of features of interest. Near-surface geophysical methods offer the capability to complement test borings by providing two- and three-dimensional images of the subsurface away and between boreholes. Such capability can be valuable in mapping features of limited lateral extent such as discontinuous strata.

faults and fracture zones boulder fields and voids Ground penetrating radar GPR is a non invasive non destructive high frequency electromagnetic method that provides high resolution imaging of electrically resistive environments GPR can be deployed on the surface and in boreholes and it can provide observations in two dimensions cross sections and three dimensions volumes GPR data used in conjunction with corehole data offer the capability to accurately map subsurface features of interest GPR imaging of the subsurface can complement and enhance the subsurface information provided by test borings Furthermore GPR can potentially reduce the number of borings required in a transportation project The objective of the project was to evaluate the utility of GPR technology in addressing Kansas transportation geologic and engineering questions Three GPR studies completed during the course of this project were GPR Imaging of Bedrock along the Kansas River at Highway K 18 near Manhattan Kansas GPR Imaging of the Ogallala Formation at Highway US 50 Near Cimarron Kansas Borehole GPR Detection of Subsurface Voids at Kansas Highway 69 Pittsburg Bypass Predictions in Ungauged Basins Murugesu Sivapalan,2006 **Compressive Sensing for Urban Radar** Moeness Amin,2017-12-19 With the emergence of compressive sensing and sparse signal reconstruction approaches to urban radar have shifted toward relaxed constraints on signal sampling schemes in time and space and to effectively address logistic difficulties in data acquisition Traditionally these challenges have hindered high resolution imaging by restricting both bandwidth and aperture and by imposing uniformity and bounds on sampling rates Compressive Sensing for Urban Radar is the first book to focus on a hybrid of two key areas compressive sensing and urban sensing It explains how reliable imaging tracking and localization of indoor targets can be achieved using compressed observations that amount to a tiny percentage of the entire data volume Capturing the latest and most important advances in the field this state of the art text Covers both ground based and airborne synthetic aperture radar SAR and uses different signal waveforms Demonstrates successful applications of compressive sensing for target detection and revealing building interiors Describes problems facing urban radar and highlights sparse reconstruction techniques applicable to urban environments Deals with both stationary and moving indoor targets in the presence of wall clutter and multipath exploitation Provides numerous supporting examples using real data and computational electromagnetic modeling Featuring 13 chapters written by leading researchers and experts Compressive Sensing for Urban Radar is a useful and authoritative reference for radar engineers and defense contractors as well as a seminal work for graduate students and academia Near-surface Geophysics Dwain K.
