Jayaweera,2005 Author s abstract The recent increase in the wide use of digital imaging technologies in consumer e g digital video and other markets e g security and military has brought with it a simultaneous demand for higher resolution images or super resolution images as popularly termed Most of the super resolution techniques available in literature assume a Gaussian noise model which restricts their applicability and analysis to a particular data set In order to make the reconstruction framework robust to the impulsive noise a more generalized model is necessary This thesis investigates a technique called zoom based robust super resolution technique to reconstruct a super resolved image from a set of low resolution images zoomed to different zoom factors The proposed reconstruction algorithm based on the M estimator method effectively combats the impulsive noise present in the low resolution images This robustness of the proposed algorithm is also confirmed by the numerical results **Development of Super-resolution for Brain MRI Images** □□□,2023 *Zoom-based Super-resolution Image Reconstruction from Images with Different Orientations* Chandana K. K. Jayasooriya,2006 Construction of a mosaic image using a set of low resolution images taken at different zoom settings and at

different angles was investigated in this thesis The proposed reconstruction algorithm uses the zoom based super resolution technique based on maximum likelihood estimate A computationally less intensive point matching algorithm was introduced based on a known algorithm The simulation results show that the implemented algorithm can find point correspondences of images successfully even they are differently zoomed that helps for image registration
