Optimized-Motion Planning Cherif Ahrikencheikh, Ali A. Seireg, 1994-10-14 The first handbook to the practical specifics of motion planning Optimized Motion Planning offers design engineers methods and insights for solving real motion planning problems in a 3 dimensional space Complete with a disk of software programs this unique guide allows users to design test and implement possible solutions useful in a host of contexts especially tool path planning Beginning with a brief overview of the general class of problems examined within the book as well as available solution techniques Part 1 familiarizes the reader with the conceptual threads that underlie each approach This early discussion also considers the specific applications of each technique as well as its computational efficiency Part 2 illustrates basic problem solving methodology by considering the case of a point moving between stationary polygons in a plane This section features algorithms for data organization and storage the concepts of passage networks and feasibility charts as well as the path optimization algorithm Elaborating on the problematic model described in Part 2 Part 3 develops an algorithm for optimizing the motion of a point between stationary polyhedra in a 3 dimensional space This algorithm is first applied to the case of nonpoint objects moving between obstacles that can be stationary or moving with known patterns It is then used in connection with the extensively investigated problem of motion planning for multilink manipulators

**Motion planning and feedback control techniques with applications to long tractor-trailer vehicles** Oskar Ljungqvist, 2020-04-20 During the last decades improved sensor and hardware technologies as well as new methods and algorithms have made self driving vehicles a realistic possibility in the near future At the same time there has been a growing demand within the transportation sector to increase efficiency and to reduce the environmental impact related to transportation of people and

goods Therefore many leading automotive and technology companies have turned their attention towards developing advanced driver assistance systems and self driving vehicles Autonomous vehicles are expected to have their first big impact in closed environments such as mines harbors loading and offloading sites In such areas the legal requirements are less restrictive and the surrounding environment is more controlled and predictable compared to urban areas Expected positive outcomes include increased productivity and safety reduced emissions and the possibility to relieve the human from performing complex or dangerous tasks Within these sites tractor trailer vehicles are frequently used for transportation These vehicles are composed of several interconnected vehicle segments and are therefore large complex and unstable while reversing This thesis addresses the problem of designing efficient motion planning and feedback control techniques for such systems The contributions of this thesis are within the area of motion planning and feedback control for long tractor trailer combinations operating at low speeds in closed and unstructured environments It includes development of motion planning and feedback control frameworks structured design tools for guaranteeing closed loop stability and experimental validation of the proposed solutions through simulations lab and field experiments Even though the primary application in this work is tractor trailer vehicles many of the proposed approaches can with some adjustments also be used for other systems such as drones and ships The developed sampling based motion planning algorithms are based upon the probabilistic closed loop rapidly exploring random tree CL RRT algorithm and the deterministic lattice based motion planning algorithm It is also proposed to use numerical optimal control offline for precomputing libraries of optimized maneuvers as well as during online planning in the form of a warm started optimization step To follow the motion plan several predictive path following control approaches are proposed with different computational complexity and performance Common for these approaches are that they use a path following error model of the vehicle for future predictions and are tailored to operate in series with a motion planner that computes feasible paths The design strategies for the path following approaches include linear quadratic LQ control and several advanced model predictive control MPC techniques to account for physical and sensing limitations To strengthen the practical value of the developed techniques several of the proposed approaches have been implemented and successfully demonstrated in field experiments on a full scale test platform To estimate the vehicle states needed for control a novel nonlinear observer is evaluated on the full scale test vehicle It is designed to only utilize information from sensors that are mounted on the tractor making the system independent of any sensor mounted on the trailer Under de senaste årtiondena har utvecklingen av sensor och hrdvaruteknik gått i en snabb takt samtidigt som nya metoder och algoritmer har introducerats Samtidigt ställs det stora krav på transportsektorn att öka effektiviteten och minska miljöpåverkan vid transporter av både människor och varor Som en följd av detta har många ledande fordonstillverkare och teknikföretag börjat satsa på att utveckla avancerade fjärrstyrda system och självkörande fordon Vår forskning inom autonoma fordon har under de senaste årtiondena kraftigt ökat den redan tekniska problematiken för att låsa fria fordon från väntas för sitt första stora genombrott i slutna

miljöer som gruvor hamnar lastnings och lossningsplatser I sådana områden lagstiftningen mindre hörd jämfört med stadsområden och omgivningen är mer kontrollerad och förutsätter N-göra av de förväntade positiva effekterna på produktivitet och säkerhet minskade utsläpp och möjligheten att avlasta människor från att utföra svåra eller farliga uppgifter Inom dessa platser används ofta lastbilar med olika släpvagnskombinationer för att transportera material En sådan fordonskombination är uppbyggd av flera ihopkopplade moduler och rullas ledes utmanande att backa då systemet är instabilt Detta gör det svårt att utforma ramverk för att styra sådana system vid exempelvis autonom backning Självkörande fordon är mycket komplexa system som består av en rad olika komponenter vilka är designade för att lösa separata delproblem Två viktiga komponenter i ett självkörande fordon är dels planeringsaren som har i uppgift att planera hur fordonet ska röra sig för att på ett säkert sätt nå ett förordnat mål och dels den banföljande regulatorn vars uppgift är att se till att den planerade manövern faktiskt utförs i praktiken trots störningar och modellfel I denna avhandling presenteras flera olika algoritmer för att planera och utföra komplexa manövrer för lastbilar med olika typer av släpvagnskombinationer De presenterade algoritmerna är avsedda att användas som avancerade förarstödsystem eller som komponenter i ett helt autonomt system även om den primära applikationen i denna avhandling är lastbilar med släpkan manövrer av de förslagna algoritmerna även användas för en rad andra system så som dragnare och bärare Experimentell validering är viktigt för att motivera att en förslagen algoritm är användbar i praktiken I denna avhandling har flera av de förslagna planerings- och reglerstrategierna implementerats på en småskalig testplattform och utvärderats i en kontrollerad labbmiljö Utöver detta har även flera av de förslagna ramverken implementerats och utvärderats i ett experiment på en fullskalig testplattform som har utvecklats i samarbete med Scania CV Huvudutvärderas även en ny metod för att skatta släpvagnens beteende genom att endast utnyttja information från sensorer monterade på lastbilen vilket gör det förslagna ramverket oberoende av sensorer monterade på släpvagnen

**Implementation and Experimentation with Motion Planning Algorithms**, 1990 The main charter of this contract is the implementation and experimentation with motion planning algorithms that emphasize the exact

combinatorial and purely geometric approach Motion planning is considered to be one of the major research areas in robotics and is one of the main stages in the design and implementation of autonomous intelligent systems which is an important long range goal in robotics research Motion planning is one of the basic capabilities that such a system must possess In purely geometric terms the simplest version of the problem can be stated as follows The system is given complete information about the geometry of the environment in which it is to operate and of its own structure and has to process it so that when commanded to move from its current position to some target position it can determine whether it can do so without colliding with any of the obstacles around it and if so plan and execute such a motion These are many variants of the problem A few of those are motion planning in environments that are only partially known to the system compliant motion planning that allows contact with obstacles which might be unavoidable due to measurement errors optimal motion planning motion planning with kino dynamic constraints and motion planning amidst moving obstacles Still even the simplest static and purely geometric version stated above is far from being simple and poses serious challenges in the design of efficient and robust algorithms

**Exploiting Direct Optimal Control for Motion Planning in Unstructured Environments** Kristoffer Bergman,2021-03-16 During the last decades motion planning for autonomous systems has become an important area of research The high interest is not the least due to the development of systems such as self driving cars unmanned aerial vehicles and robotic manipulators The objective in optimal motion planning problems is to find feasible motion plans that also optimize a performance measure From a control perspective the problem is an instance of an optimal control problem This thesis addresses optimal motion planning problems for complex dynamical systems that operate in unstructured environments where no prior reference such as road lane information is available Some example scenarios are autonomous docking of vessels in harbors and autonomous parking of self driving

tractor trailer vehicles at loading sites The focus is to develop optimal motion planning algorithms that can reliably be applied to these types of problems This is achieved by combining recent ideas from automatic control numerical optimization and robotics The first contribution is a systematic approach for computing local solutions to motion planning problems in challenging unstructured environments The solutions are computed by combining homotopy methods and direct optimal control techniques The general principle is to define a homotopy that transforms or preferably relaxes the original problem to an easily solved problem The approach is demonstrated in motion planning problems in 2D and 3D environments where the presented method outperforms a state of the art asymptotically optimal motion planner based on random sampling The second contribution is an optimization based framework for automatic generation of motion primitives for lattice based motion planners Given a family of systems the user only needs to specify which principle types of motions that are relevant for the considered system family Based on the selected principle motions and a selected system instance the framework computes a library of motion primitives by simultaneously optimizing the motions and the terminal states The final contribution of this thesis is a motion planning framework that combines the strengths of sampling based planners with direct optimal control in a novel way The sampling based planner is applied to the problem in a first step using a discretized search space where the system dynamics and objective function are chosen to coincide with those used in a second step based on optimal control This combination ensures that the sampling based motion planner provides a feasible motion plan which is highly suitable as warm start to the optimal control step Furthermore the second step is modified such that it also can be applied in a receding horizon fashion where the proposed combination of methods is used to provide theoretical guarantees in terms of recursive feasibility worst case objective function value and convergence to the terminal state The proposed motion planning framework is successfully applied to several problems in challenging unstructured environments for tractor trailer vehicles The framework is also applied and tailored for maritime navigation for vessels in archipelagos and harbors where it is able to compute energy efficient trajectories which complies with the international regulations for preventing collisions at sea

Alterovitz,2006 **Robot Motion Planning** Jean-Claude Latombe,2012-12-06 One of the ultimate goals in Robotics is to create autonomous robots Such robots will accept high level descriptions of tasks and will execute them without further human intervention The input descriptions will specify what the user wants done rather than how to do it The robots will be any kind of versatile mechanical device equipped with actuators and sensors under the control of a computing system Making progress toward autonomous robots is of major practical interest in a wide variety of application domains including manufacturing construction waste management space exploration undersea work assistance for the disabled and medical surgery It is also of great technical interest especially for Computer Science because it raises challenging and rich computational issues from which new concepts of broad usefulness are likely to emerge Developing the technologies

necessary for autonomous robots is a formidable undertaking with deep interweaved ramifications in automated reasoning perception and control It raises many important problems One of them motion planning is the central theme of this book It can be loosely stated as follows How can a robot decide what motions to perform in order to achieve goal arrangements of physical objects This capability is eminently necessary since by definition a robot accomplishes tasks by moving in the real world The minimum one would expect from an autonomous robot is the ability to plan its own motions
