How do we measure population growth?

How do we measure population growth?

What does population growth mean? It is the change in the number of individuals in a population over time. This is measured by the **growth rate**, which is the change in population size divided by the change in time. The growth rate can be measured in different ways, depending on the units used. For example, it can be measured as the number of individuals added per unit time, or as the percentage increase in population size per unit time. The latter is often used because it allows for comparison between different populations, regardless of their initial size. The growth rate is also related to the **reproduction rate**, which is the average number of offspring produced by an individual over its lifetime. The growth rate is a key parameter in population biology, as it determines whether a population is growing, stable, or declining. It is also important for understanding the evolution of a population, as it affects the rate at which genetic changes are passed on to future generations.
