

Composites Modeler

State-of-the-art fiber simulation and ply modeling, with property verification, results utilities and direct integration with the Layup Pipeline

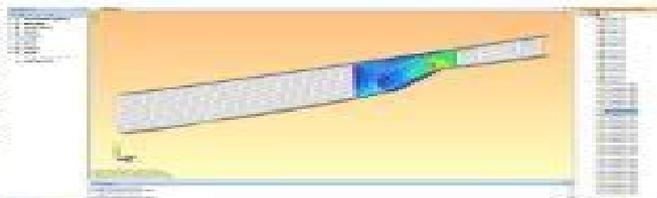

for Femap

Composites Modeler for Femap (CMF) provides proven fiber simulation capabilities and advanced ply-based model building — all seamlessly integrated within Femap. Analysis properties are generated and verified efficiently. Layered results can be calculated and browsed. Finally, complete integration with Simulayt's Layup Pipeline allows direct linkage with Design and Manufacture functions.

The fiber simulation ensures that unmanufacturable plies cannot be specified, right at the beginning of the process. This avoids costly re-engineering late in the development cycle. Manufacturing data is generated to ensure that the final part matches the analysis model.

Now, continuously-varying fiber orientations and ply thicknesses can be fed directly to solvers for detailed analysis. The resultant orientation of plies on each element faithfully reflects the simulated and actual fiber architecture. This ensures simulations of unprecedented fidelity. Analysis results can be sorted by global ply for realistic interpretation, and failure loads determined.

CAPABILITIES

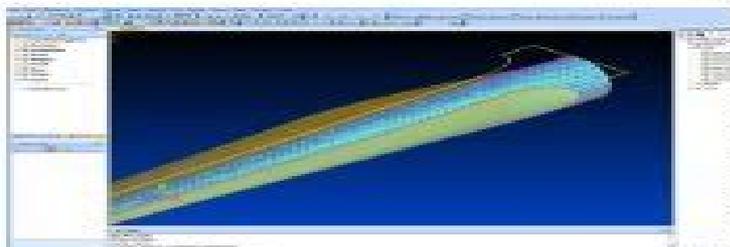

- State-of-the-art fiber simulation, proven since 1992.
- Efficient ply-based layup modeling to reflect manufacture and allow rapid modification.
- Automated analysis property generation and verification.
- Efficient results visualisation, sorting by global ply, and calculation of failure.
- Direct integration with the Layup Pipeline for seamless communication across the enterprise.

BENEFITS

- Prevents specification of plies and structures that cannot be manufactured, avoiding costly mistakes.
- Improves model fidelity and reduces setup time to allow rapid design improvement.
- Allows seamless analysis, design and manufacture integration across the enterprise to promote development efficiency.

Mechcomp3 Antonio J.M. Ferreira, Erasmo Viola, Francesco Tornabene, Nicholas Fantuzzi, 2017-05-25 The use of composite materials has grown exponentially in the last decades and has affected many engineering fields due to their enhanced mechanical properties and improved features with respect to conventional materials For instance they are employed in civil engineering seismic isolators long span bridges vaults mechanical engineering turbines machine components aerospace and naval engineering fuselages boat hulls and sails automotive engineering car bodies tires and biomechanical engineering prostheses Nevertheless the greater use of composites requires a rapid progress in gaining the needed knowledge to design and manufacture composite structures Thus researchers and designers devote their own efforts to develop new analysis techniques design methodologies manufacturing procedures micromechanics approaches theoretical models and numerical methods For these purpose it is extremely easy to find many recent journal papers books and technical notes focused on the mechanics of composites In particular several studies are presented to take advantage of their superior features by varying some typical structural parameters such as geometry fiber orientations volume fraction structural stiffness weight lamination scheme Therefore this Conference aims to collect contributions from every part of the globe that can increase the knowledge of composite materials and their applications by engaging researches and professional engineers and designers from different sectors The same aims and scopes have been reached by the previous editions of Mechanics of
