Title: GitHub's Battle Against the Largest DDoS Attack

Introduction

GitHub, a platform where developers collaborate on projects, experienced an extraordinary event on Wednesday, February 28, 2018, at around 12:15 pm EST. A massive wave of traffic, 1.35 terabits per second, hit the website, marking the most powerful distributed denial of service (DDoS) attack ever recorded. Surprisingly, this attack did not require a botnet.

The Attack and Initial Response

A DDoS attack is like a digital traffic jam, where a website gets flooded with so much traffic that it can't handle it all, causing it to slow down or even stop working. In this case, GitHub faced a digital storm. For a few minutes, the website struggled with outages, but then it called for help from its DDoS mitigation service, Akamai Prolexic. Prolexic acted as a shield, routing all the traffic coming in and out of GitHub. It sent the data through special cleaning centers to separate and block the bad traffic from the good.

Comparing to Previous Attacks

The attack was significantly larger than a similar attack that happened in 2016 against an internet infrastructure company called Dyn. That attack reached 1.2 terabits per second and caused connectivity issues across the United States. However, this time, the good guys were prepared.

Defending Against the Attack

Akamai defended against the attack in several ways. In addition to Prolexic's general DDoS defense infrastructure, the company had also recently implemented specific defenses for a type of DDoS attack that comes from something called memcached servers. These servers are like digital librarians that help speed up networks and websites by remembering and quickly providing information. However, they're not supposed to be exposed on the public internet, where anyone can access them.

The Role of Memcached Servers

Unfortunately, about 100,000 memcached servers were exposed online without any protection. This meant that an attacker could access them and send them a special command, which the server would respond to with a much larger reply. This is like asking a librarian a simple question and getting a truckload of books in response!

Amplification Attacks

Unlike other DDoS attacks that use botnets (networks of infected computers) to flood websites with traffic, memcached DDoS attacks don't need a botnet. Instead, attackers just pretend to be their victim by using their victim's IP address and send small requests to multiple memcached

The New Era of Cybersecurity Breaches Graeme Payne, 2019-08-08. Over the last decade, as companies have continued to march forward on the digitization of everything, the cybersecurity risk profile has continued to change. Since 2005, there have been over 9,000 publicly disclosed data breaches. In the last five years, the financial losses due to cyber attacks have risen by over 62%. Identifying, mitigating, and managing cybersecurity risks in today's environment is a challenging task. On July 29, 2017, Equifax discovered criminal hackers had broken into its systems. Graeme Payne was one of the first senior executives to be told about the attack. Six weeks later, Equifax announced that the personal information of over 140 million US consumers had been exposed in one of the largest data breaches of the 21st Century. What followed was a challenging response that drew widespread criticism. Graeme Payne was fired on October 2, the day before former Chairman CEO Richard Smith testified to Congress that the root cause of the data breach was a human error and a technological failure. Graeme Payne would later be identified as the human error. In *The New Era of Cybersecurity Breaches*, Graeme Payne describes the new era of cybersecurity breaches, the challenges of managing cybersecurity, and the story of the Equifax Cybersecurity Breach. Graeme tells the story of how Equifax became a valuable target for cybercriminals, the conclusions reached by various investigators regarding the cause of the breach, the challenges faced by Equifax in responding to the breach, and the widespread consequences that continue to have an impact. *The New Era of Cybersecurity Breaches* is a must-read for board members, executives, managers, and security leaders. This book will help you understand the importance of implementing strong procedural, technical, and people controls to secure your systems. Essential lessons in preparing for and responding to a major data breach when not if one occurs. The critical role boards and senior leaders have in your organization's cybersecurity program. The lessons learned from major cybersecurity breaches, including the Equifax 2017 Data Breach, can be applied to your company to test and improve your cybersecurity posture.
