Graham V. Weinberg, 2023-08-31 This book presents a unique and comprehensive introduction to performance prediction of directed energy DE systems using mathematical modeling frameworks with focus on high power radio frequency and high energy laser performance It provides system designers with a means for predicting DE system performance and measuring the required power levels necessary to neutralize targets including UAVs and other unmanned swarms The book begins with a systematic and concise overview of DE systems including its historical roots You will then learn how to develop effective mathematical models and understand how to use these models to implement safer and efficient use of DE systems in various scenarios A special section is devoted to examples and attributes of unmanned systems since these are viewed as primary targets suitably disabled by DE systems There is also an extensive survey of the relevant tools of mathematics and physics for DE systems together with a series of pertinent references you can follow for further information The final section of the book outlines potential future research directions that interested researchers are encouraged to pursue With its exclusive and unmatched coverage of predictive modeling for DE systems and performance this is an important book for engineers and operators working in the defense industry including government and private contractors as well as research practitioners at universities and engineering organizations worldwide working in the field of DE system performance Computer

Architecture Performance Evaluation Methods Lieven Eeckhout, 2022-05-31 Performance evaluation is at the foundation of computer architecture research and development Contemporary microprocessors are so complex that architects cannot design systems based on intuition and simple models only Adequate performance evaluation methods are absolutely crucial to steer the research and development process in the right direction However rigorous performance evaluation is non trivial as there are multiple aspects to performance evaluation such as picking workloads selecting an appropriate modeling or simulation approach running the model and interpreting the results using meaningful metrics Each of these aspects is equally important and a performance evaluation method that lacks rigor in any of these crucial aspects may lead to inaccurate performance data and may drive research and development in a wrong direction The goal of this book is to present an overview of the current state of the art in computer architecture performance evaluation with a special emphasis on methods for exploring processor architectures The book focuses on fundamental concepts and ideas for obtaining accurate performance data The book covers various topics in performance evaluation ranging from performance metrics to workload selection to various modeling approaches including mechanistic and empirical modeling And because simulation is by far the most prevalent modeling technique more than half the book s content is devoted to simulation The book provides an overview of the simulation techniques in the computer designer s toolbox followed by various simulation acceleration techniques including sampled simulation statistical simulation parallel simulation and hardware accelerated simulation Table of Contents Introduction Performance Metrics Workload Design Analytical Performance Modeling Simulation Sampled Simulation Statistical Simulation Parallel Simulation and Hardware Acceleration Concluding Remarks **Computer and**
