Introduction to Reliable and Secure Distributed Programming Christian Cachin, Rachid Guerraoui, Luís Rodrigues, 2011-02-11 In modern computing a program is usually distributed among several processes The fundamental challenge when developing reliable and secure distributed programs is to support the cooperation of processes required to execute a common task even when some of these processes fail Failures may range from crashes to adversarial attacks by malicious processes Cachin Guerraoui and Rodrigues present an introductory description of fundamental distributed programming abstractions together with algorithms to implement them in distributed systems where processes are subject to crashes and malicious attacks The authors follow an incremental approach by first introducing basic abstractions in simple distributed environments before moving to more sophisticated abstractions and more challenging environments Each core chapter is devoted to one topic covering reliable broadcast shared memory consensus and extensions of consensus For every topic many exercises and their solutions enhance the understanding This book represents the second edition of Introduction to Reliable Distributed Programming Its scope has been extended to include security against malicious actions by non cooperating processes This important domain has become widely known under the name Byzantine fault tolerance

Principles of Distributed Systems Vijay K. Garg, 2012-12-06 Distributed computer systems are now widely available but despite a number of recent advances the design of software for these systems remains a challenging

task involving two main difficulties the absence of a shared clock and the absence of a shared memory The absence of a shared clock means that the concept of time is not useful in distributed systems The absence of shared memory implies that the concept of a state of a distributed system also needs to be redefined These two important concepts occupy a major portion of this book Principles of Distributed Systems describes tools and techniques that have been successfully applied to tackle the problem of global time and state in distributed systems The author demonstrates that the concept of time can be replaced by that of causality and clocks can be constructed to provide causality information The problem of not having a global state is alleviated by developing efficient algorithms for detecting properties and computing global functions The author's major emphasis is in developing general mechanisms that can be applied to a variety of problems For example instead of discussing algorithms for standard problems such as termination detection and deadlocks the book discusses algorithms to detect general properties of a distributed computation Also included are several worked examples and exercise problems that can be used for individual practice and classroom instruction Audience Can be used to teach a one semester graduate course on distributed systems Also an invaluable reference book for researchers and practitioners working on the many different aspects of distributed systems *Distributed Systems* Ratan K. Integrated Model of Distributed Systems Wiktor B. Daszczuk, 2019-03-16 In modern distributed systems such as the Internet of Things or cloud computing verifying their correctness is an essential aspect This requires modeling approaches that reflect the natural characteristics of such systems the locality of their components autonomy of their decisions and their asynchronous communication However most of the available verifiers are unrealistic because one or more of these features are not reflected Accordingly in this book we present an original formalism the Integrated Distributed Systems Model IMDS which defines a system as two sets states and messages and a relation of the actions between these sets The server view and the traveling agent s view of the system provide communication duality while general temporal formulas for the IMDS allow automatic verification The features that the model checks include partial deadlock and partial termination communication deadlock and resource deadlock Automatic verification can support the rapid development of distributed systems Further on the basis of the IMDS the Dedan tool for automatic verification of distributed systems has been developed *Distributed Algorithms for Message-Passing Systems* Michel Raynal, 2013-06-29 Distributed computing is at the heart of many applications It arises as soon as one has to solve a problem in terms of entities such as processes peers processors nodes or

agents that individually have only a partial knowledge of the many input parameters associated with the problem. In particular, each entity cooperating towards the common goal cannot have an instantaneous knowledge of the current state of the other entities. Whereas parallel computing is mainly concerned with efficiency and real-time computing is mainly concerned with on-time computing, distributed computing is mainly concerned with mastering uncertainty created by issues such as the multiplicity of control flows, asynchronous communication, unstable behaviors, mobility, and dynamicity. While some distributed algorithms consist of a few lines only, their behavior can be difficult to understand and their properties hard to state and prove. The aim of this book is to present in a comprehensive way the basic notions, concepts, and algorithms of distributed computing when the distributed entities cooperate by sending and receiving messages on top of an asynchronous network. The book is composed of seventeen chapters structured into six parts: distributed graph algorithms, in particular what makes them different from sequential or parallel algorithms; logical time and global states, the core of the book; mutual exclusion and resource allocation; high-level communication abstractions; distributed detection of properties and distributed shared memory. The author establishes clear objectives per chapter, and the content is supported throughout with illustrative examples, summaries, exercises, and annotated bibliographies. This book constitutes an introduction to distributed computing and is suitable for advanced undergraduate students or graduate students in computer science and computer engineering, graduate students in mathematics interested in distributed computing, and practitioners and engineers involved in the design and implementation of distributed applications. The reader should have a basic knowledge of algorithms and operating systems.

Intelligent Computing, Communication and Devices Lakhmi C. Jain, Srikanta Patnaik, Nikhil Ichalkaranje, 2014-08-28. In the history of mankind, three revolutions which impact human life are the tool-making revolution, agricultural revolution, and industrial revolution. They have transformed not only the economy and civilization but the overall development of the society. Probably, intelligence revolution is the next revolution which the society will perceive in the next 10 years. ICCD 2014 covers all dimensions of intelligent sciences, i.e., Intelligent Computing, Intelligent Communication, and Intelligent Devices. This volume covers contributions from Intelligent Communication, which are from the areas such as Communications and Wireless Ad Hoc Sensor Networks, Speech, Natural Language Processing, including Signal, Image, and Video Processing, and Mobile broadband and Optical networks, which are the key to the ground-breaking inventions to intelligent communication technologies. Secondly, Intelligent Device is any type of equipment, instrument, or machine that has its own computing capability. Contributions from the areas such as Embedded Systems, RFID, RF MEMS, VLSI Design, Electronic Devices, Analog and Mixed Signal IC Design and Testing, MEMS and Microsystems, CMOS MEMS, Solar Cells, and Photonics, Nano Devices, Single Electron Spintronics Devices, Space Electronics, and Intelligent Robotics are covered in this volume.

Recent Development in Wireless Sensor and Ad-hoc Networks Srikanta Patnaik, Xiaolong Li, Yeon-Mo Yang, 2014-12-01. Wireless Sensor Network (WSN) consists of numerous physically distributed autonomous devices
