

Human Body: Endocrine System

The endocrine system contains 9 major glands and organs that produce, store, and secrete hormones.

Brain

1 Hypothalamus

Maintains the body's homeostasis and regulates body temperature, heart rate, and blood pressure.

2 Pituitary Gland

Composed of 2 lobes: the anterior, which secretes hormones involved in the body's growth and development, and the posterior, which secretes hormones that increase the reabsorption of water into the kidneys.

3 Pineal Gland

Responsible for the production of melatonin, which plays a major role in the body's sleep-wake cycle.

Thyroid

This butterfly-shaped gland produces 3 major hormones: calcitonin, triiodothyronine (T3), and thyroxine (T4). They help regulate the body's energy and metabolism.

Parathyroid

The parathyroid, also referred to as the hypophysis, secretes hormones necessary for calcium absorption.

Thymus

The thymus controls production of T-cells (white blood cells) and plays a vital role in the body's ability to fight diseases.

Ovaries/Testes

The male and female reproductive organs release hormones responsible for blood circulation, mental vigor, and sex drive.

Ovary

Secretes estrogen and progesterone, which play a key role in the health of the female reproductive system.

Testis

Secretes testosterone, which is vital for physical development, bone density, and libido in males.

8 Pancreas

Aids in the digestion of proteins, fats, and carbohydrates. Responsible for the production of insulin and glucagon, which regulate the level of glucose in the blood.

9 Adrenal Gland

Produces hormones that allow the body to react to stress, such as adrenaline and cortisol.
