## **The Ecology Of Adaptive Radiation:**

The Ecology of Adaptive Radiation Dolph Schluter, 2000-08-31 Adaptive radiation is the evolution of diversity within a rapidly multiplying lineage. It can cause a single ancestral species to differentiate into an impressively vast array of species inhabiting a variety of environments. Much of life's diversity has arisen during adaptive radiations. Some of the most famous recent examples include the East African cichlid fishes, the Hawaiian silverswords, and of course Darwin's Galapagos finches. This book evaluates the causes of adaptive radiation. It focuses on the ecological theory of adaptive radiation, a body of ideas that began with Darwin and was developed through the early part of the 20th Century. This theory proposes that phenotypic divergence and speciation in adaptive radiation are caused ultimately by divergent natural selection arising from differences in environment and competition between species. In *The Ecology of Adaptive Radiation*, the author re-evaluates the ecological theory along with its most significant extensions and challenges in the light of all the recent evidence. This important book is the first full exploration of the causes of adaptive radiation to be published for decades, written by one of the world's best young evolutionary biologists.

**The Ecology of Adaptive Radiation** Dolph Schluter, 2000-09-07 a scholarly work of great clarity and force of argument. It is essential reading for all students of evolution, a book that will take its place near the ones by Dobzhansky, Lack, Mayr, and Simpson that inspired it. Peter R. Grant, *Quarterly Review of Biology*. In each decade, one book stands out in terms of its influence on the field of evolutionary biology. Although only one year old, this decade might have already produced its member of this pantheon: Dolph Schluter, *The Ecology of Adaptive Radiation*. It will lead to new avenues of research and new ways of thinking about adaptive radiation. Jonathan B. Losos, *Trends in Ecology and Evolution*. Presents an impressively thorough evaluation of the empirical evidence that has accumulated since Simpson's synthesis. An absolute must-read for all graduate students in the fields of ecology and evolution and for anyone interested in evolutionary diversity. It will become a classic. Axel Meyer, *Science*. Should be read and regularly consulted by anybody interested in adaptive radiation, in natural selection, and in speciation. Konrad Bachmann, *Plant Systematics and Evolution*. Much of life's diversity was generated by adaptive radiation: concentrated bursts of evolution during which new species rapidly formed, diverging from a common ancestor in ecology and phenotype. There are many living examples of this spectacular phenomenon; the most famous include the East African cichlid fishes, the Hawaiian silverswords, and of course Darwin's Galapagos finches. This book evaluates the causes of adaptive radiation, focusing on the ecological theory, a body of ideas that began with Darwin. The author re-evaluates the ecological theory along with its most significant extensions and challenges in the light of all the recent evidence. This important book is the first full exploration of the causes of adaptive radiation to be written for decades by one of the world's leading young evolutionary biologists.

Lizards in an Evolutionary Tree Jonathan Losos, 2009-08-15 Adaptive radiation, which results when a single ancestral species gives rise to many descendants, each adapted to a different part of the environment, is possibly the single most important source of biological

diversity in the living world One of the best studied examples involves Caribbean Anolis lizards With about 400 species Anolis has played an important role in the development of ecological theory and has become a model system exemplifying the integration of ecological evolutionary and behavioral studies to understand evolutionary diversification This major work written by one of the best known investigators of Anolis reviews and synthesizes an immense literature Jonathan B Losos illustrates how different scientific approaches to the questions of adaptation and diversification can be integrated and examines evolutionary and ecological questions of interest to a broad range of biologists [The Year in Evolutionary Biology 2009, Volume 1168](#) Carl D. **The Ecology of Adaptive Radiation of Dabbling Ducks (Anas Spp.)** David Brent Gurd, 2005 The ecological theory of adaptive radiation proposes that three processes are responsible for the evolution of a single ancestor into a clade of species divergence in phenotype between contrasting environments divergence in phenotype caused by negative interspecific interactions and ecological speciation I tested for evidence of these processes among sympatric

dabbling ducks *Anas* spp a putative adaptive radiation Divergent selection between environments requires a trade off in the ability of phenotypes to exploit resources in different environments I tested whether variation in bill morphology imposes a performance trade off when ducks filter feed in environments containing different size frequency distributions of prey and indigestible detritus Experiments demonstrated that ducks could avoid ingesting detritus when prey and detritus differ in size Foraging models based on filter feeding biomechanics predict prey size selection causes a decline in filtration rates and that the form of this trade off depends on interspecific differences in bill morphology To test these models I used them to predict the results of manipulative foraging experiments on 2 species reported in the literature There was overall agreement between model predictions and reported differences in filtration rates particle retention probabilities and ingestion rates both between species and due to variation in prey size presence of detritus and surgical manipulation of bill morphology Extension of these models to five additional species predicts that interspecific variation in the foraging trade off should result in interspecific partitioning of prey by size when detritus is present To determine if phenotypic divergence is the result of negative interspecific interactions I tested for a negative correlation between frequencies of interspecific aggression and phenotypic divergence Comparison of observed frequencies to the predictions of a null model indicated aggression differed between species pairs Divergence in body size body length lamellar density and divergence of species along a prey size axis predicted by the biomechanical models were all negatively correlated with frequency of aggression even after controlling for phylogenetic distance Variation in aggression accounted for by phenotype and phylogeny were additive indicating ecology and evolutionary history contribute independently to species interactions These results provide evidence that dabbling ducks represent an adaptive radiation
