Engineering Cybernetics, 1968 **Engineering Cybernetics**, 1967 **Fundamentals of Engineering Cybernetics** Eduard Aleksandrovich IĭAĭkubaĭtis, 1965 *Agricultural Cybernetics* Yanbo Huang, Qin Zhang, 2021-08-17

Agricultural systems are uniquely complex systems given that agricultural systems are parts of natural and ecological systems. Those aspects bring in a substantial degree of uncertainty in system operation. Also, impact factors such as weather factors are critical in agricultural systems but these factors are uncontrollable in system management. Modern agriculture has been evolving through precision agriculture beginning in the late 1980s and biotechnological innovations in the early 2000s. Precision agriculture implements site specific crop production management by integrating agricultural mechanization and information technology in geographic information system GIS, global navigation satellite system GNSS, and remote sensing. Now precision agriculture is set to evolve into smart agriculture with advanced systematization, informatization, intelligence, and automation. From precision agriculture to smart agriculture, there is a substantial amount of specific control and communication problems that have been investigated and will continue to be studied. In this book, the core ideas and methods from control problems in agricultural production systems are extracted, and a system view of agricultural production is formulated for the analysis and design of management strategies to control and optimize agricultural production systems while exploiting the intrinsic feedback information exchanging mechanisms. On this basis, the theoretical framework of agricultural cybernetics is established to predict and control the behavior of agricultural production systems through control theory.

Artificial Self-recovery and Autonomous Health of Machine Gao Jinji, 2022-10-27. Engineering Cybernetics Hsue Shen Tsien, Xuesen Qian, 1954 **Design of Embedded Control Systems** Marian Andrzej Adamski, Andrei Karatkevich, Marek Wegrzyn, 2006-11-22. A set of original results in the field of high-level design of logical control devices and systems is presented in this book. These concern different aspects of such important and long-term design problems, including the following, which seem to be the main ones: First, the behavior of a device under design must be described properly, and some adequate formal language should be chosen for that. Second, effective algorithms should be used for checking the prepared description for correctness for its syntactic and semantic veri-

ation at the initial behavior level Third the problem of logic circuit implementation must be solved using some concrete technological base Efficient methods of logic synthesis test and verification should be developed for that Fourth the task of the communication between the control device and controlled objects and maybe between different control devices waits for its solution All these problems are hard enough and cannot be successfully solved without efficient methods and algorithms oriented toward computer implementation Some of these are described in this book The languages used for behavior description have been descended usually from two well known abstract models which became classic Petri nets and finite state machines FSMs Anyhow more detailed versions are developed and described in the book which enable to give more complete information concerning specific qualities of the regarded systems For example the model of parallel automaton is presented which unlike the conventional finite automaton can be placed simultaneously into several places called partial As a base for circuit implementation of control algorithms FPGA is accepted in majority of cases
