to be re optimized immediately to maintain peak efficiency Even though many traffic signal control systems have been upgraded from pre timed controllers to actuated and adaptive controllers the traffic signal optimization software has not been kept current For example existing commercial traffic signal timing optimization programs including SYNCHRO and TRANSYT 7F do not optimize advanced controller settings available in the modern traffic controllers including minimum green time extension time and detector settings This is in part because existing programs are based on macroscopic simulation tools that do not explicitly consider individual vehicular movements To overcome such a shortcoming a stochastic optimization method SOM was proposed and successfully applied to a signalized corridor in Northern Virginia This study presents enhancements made in the SOM and case study results from an arterial network consisting of 16 signalized intersections The proposed method employs a distributed computing environment DCE for faster computation time and uses a shuffled frog leaping algorithm SFLA for better optimization The case study results showed that the proposed enhanced SOM method called SFLASOM improved the total network travel times over field settings by 3 5% for Mid Day and 2 1% for PM Peak In addition corridor travel times were improved by 2 3% to 17 9% over field settings However when the new SOM timing plan was compared to the new field timing plan implemented in July 2008 the improvements were marginal showing slightly over 2% reductions in individual vehicular delay   *Unmanned Driving Systems for Smart Trains* Hui Liu,2020-11-13 Unmanned Driving Systems for Smart Trains explores the core technologies involved in unmanned driving systems for smart railways and trains from foundational theory to the latest advances The volume introduces the key technologies research results and frontiers of the field Each chapter includes practical cases to ground theory in practice Seven chapters cover key aspects of unmanned driving systems for smart trains including performance evaluation algorithm based reasoning and learning strategy main control parameters data mining and processing energy saving optimization and control and intelligent algorithm simulation platforms This book will help researchers find solutions in developing better unmanned driving systems Responds to the expansion of smart railways and the adoption of unmanned global systems Covers core technologies of unmanned driving systems for smart trains Details a large number of case studies and experimental designs for unmanned railway systems Adopts a multidisciplinary view where disciplines intersect at key points Gives both foundational theory and the latest theoretical and practical advances for unmanned railways   **Model Management and Analytics for Large Scale Systems** Bedir Tekinerdogan,Önder Babur,Loek Cleophas,Mark van den Brand,Mehmet Aksit,2019-09-14 Model Management and Analytics for Large Scale Systems covers the use of models and related artefacts such as metamodels and model transformations as central elements for tackling the complexity of building systems and managing data With their increased use across diverse settings the complexity size multiplicity and variety of those artefacts has increased Originally developed for software engineering these approaches can now be used to simplify the analytics of large scale models and automate complex data analysis processes Those in the field of data science will gain novel insights on the topic of model
