Francis-West,Lesley Robson,Darrell J.R. Evans,2012-12-06 Craniofacial development is a multistep and intricate process initially involving a number of inductive interactions that control neural and neural crest development which are followed by a series of epithelial mesenchymal interactions that control outgrowth patterning and skeletal differentiation Certain aspects of craniofacial development are unique developmental processes in higher vertebrates First in higher vertebrates the cranial neural crest in contrast to the trunk neural crest gives rise to the skeletal structures These skeletal elements include those comprising mem brane bone and secondary cartilage which with the exception of the clavicle are tissue types found exclusively in the head in higher vertebrates Second with the exception of the tongue the origin of the musculature is distinct from other regions of the body

The body and tongue muscles are formed from the segmented epithelial somites whilst the head musculature is formed from unsegmented paraxial and prechordal mesoderm. Furthermore, the signalling cascades that control myogenic differentiation appear to be distinct as determined by gene expression and the response of myogenic cells to growth factors. Finally, the neurogenic placodes which give rise to the sensory organs and some cranial ganglia are only found in the head. Over recent years there have been significant advances in our knowledge of the molecular processes that control craniofacial development in a number of animal models. This has given insight into the genes that control many aspects of head development from the initial induction of the head to the final stages of differentiation.

Sperber, Steven M. Sperber, 2018 The field of embryology has experienced a period of explosive growth since the previous edition of this book was published nearly a decade ago The insights of genetic expression in determining the unfolding of the embryonic layers have revolutionised our understanding of some of the mechanisms of embryogenesis As implied by the title of the new edition Craniofacial Embryogenetics and Development genetics is linked with embryology in this text Virtually all embryological development has an underlying genetic component and the basic science of genetics is the key in uncovering the many mysteries of embryogenesis The tools of molecular genetics have provided insights into developmental mechanisms that allow us the ability to identify transient regions of genetic expression patterns Unraveling the precise biochemical and mechanical interactions of discrete regions in the unfolding embryonic components remains a dauntingly complex challenge to understanding the conversion of the genome into the phenotype The addition of genetic information gleaned from other mammalian species might aid in dissecting human embryology into comprehensible components to understand normal and abnormal development This new edition is dedicated to this objective
