Development of a Business Model Approach** Fabian Hoeft,2019-10-24 Master s Thesis from the year 2019 in the subject Business economics Business Management Corporate Governance grade 1 3 Niederrhein University of Applied Sciences Krefeld School of Business and Economics language English abstract Today s world of mobility is characterised by a high degree of dynamism and change is becoming apparent Currently around 45 million passenger cars with conventional combustion engines powered by diesel or petrol are registered in Germany The share of electric vehicles is still well below one per cent Nevertheless the voices for sustainable and environmentally friendly transport are becoming louder One political measure in this respect is the implementation of driving bans in major German cities for some conventional combustion cars Car electrification is a solution for converting cars with conventional combustion engines to electric drives In the context of this thesis car electrification is regarded as a transition solution towards a nationwide electrified transport network of new electric cars A comprehensive concept of a business model approach from a start up perspective has been developed based on the analysis of the environment industry and customer needs Analysing the structure of the electrical conversion industry revealed that the subject of car electrification is hardly widespread and that current suppliers have only converted a smaller number of cars Besides the small scale of implementation the operational execution by existing suppliers can be considered weak in terms of competitiveness and sustainability The analysis of the needs of potential customers of car electrification using qualitative and quantitative methods has led to incredibly valuable insights for the development of the business model approach A high openness to purchase was expressed considering some of the factors mentioned such as a test drive with an electrified car before purchase and a durability guarantee of the conversion The high relevance of initial acquisition costs compared to operating expenses in the purchase decision for passenger cars is another precious insight The business model approach developed based on the findings obtained differs fundamentally from the strategies of today s providers By

incorporating the existing infrastructure of workshops and service points proximity to the end customer and scalability of the business operation can be achieved Partnering with universities and industry are two critical elements in the development of a sustainable secure and user friendly technical solution

Gijs Mom, 2004-04-26 Winner of the Engineer Historian Award from the International History and Heritage Committee of the American Society of Mechanical Engineers and the Nicholas Joseph Cugnot Award given by the Society of Automotive Historians Recent attention to hybrid cars that run on both gasoline and electric batteries has made the electric car an apparent alternative to the internal combustion engine and its attendant environmental costs and geopolitical implications Few people realize that the electric car neither a recent invention nor a historical curiosity has a story as old as that of the gasoline powered automobile and that at one time many in the nascent automobile industry believed battery powered engines would become the dominant technology In both Europe and America electric cars and trucks succeeded in meeting the needs of a wide range of consumers Before World War II as many as 30 000 electric cars and more than 10 000 electric trucks plied American roads European cities were busy with electrically propelled fire engines taxis delivery vans buses heavy trucks and private cars Even so throughout the century long history of electric propulsion the widespread conviction it was an inferior technology remained stubbornly in place an assumption mirrored in popular and scholarly memory In *The Electric Vehicle* Gijs Mom challenges this view arguing that at the beginning of the automobile age neither the internal combustion engine nor the battery powered vehicle enjoyed a clear advantage He explores the technology and marketing consumer ratio faction relationship over four generations of electric vehicle design with separate chapters on privately owned passenger cars and commercial vehicles Mom makes comparisons among European countries and between Europe and America He finds that the electric vehicle offered many advantages among them greater reliability and control less noise and pollution He also argues that a nexus of factors cultural underpowered and less rugged electric cars seemed feminine at a time when most car buyers were men structural the shortcomings of battery technology at the time and systemic the infrastructural problems of changing large numbers of batteries ultimately gave an edge to the internal combustion engine One hopes as a new generation of electric vehicles becomes a reality *The Electric Vehicle* offers a long overdue reassessment of the place of this technology in the history of street transportation

Full speed towards a sustainable future. The story of the electric car in Germany Fabian Guse, 2014-09-25 Master's Thesis from the year 2013 in the subject Business economics General grade 1.7 VU University Amsterdam language English abstract I believe in horses automobiles are a passing phenomenon 1 Kaiser Wilhelm II 1905 More than 100 years ago when the first motorized vehicles appeared on the streets Kaiser Wilhelm II was not able to see the potential of this invention and how it would change the world he lived in Today we are facing the next revolution of transportation technology electric mobility e mobility In consideration of continuous scarcity of fossil resources and progressive environmental issues caused by increasing amounts of CO2 emissions in our atmosphere a rethinking of universally accepted habits is needed Public and private transportation account for 19% of the overall CO2 emissions in Germany and is therefore one of the largest contributors to climate change and local air pollution Umweltbundesamt 2011 This circumstance also shows the great political relevance of this topic as well as the need

to make the whole industry more sustainable A sustainable innovation like the electric car can help to decrease the negative externalities of economic growth and reduce the ecological footprint of a modern day life Against this background the German government proclaims that Germany should be the leading market for e mobility aiming to have a diffusion rate of one million electric cars until 2020 Delhaes 2008 In order to achieve this they are dependent on the innovation activities of the German automotive industry But consumers as well as car manufacturers seem to be skeptical about this novelty which results in a comparable small diffusion rate of only 7114 electric cars in the end of 2012 Kraftfahrt Bundesamt 2013 For instance in Denmark the diffusion rate of new electronic cars is 30 times higher than in Germany and even The Netherlands have a rate that is 8 times higher Masson 2013 The mentioned diffusion rate shows the total number of newly registered electric cars in comparison to the total number of traditional fuel cars within a year This is curious on a first view as Germany has the largest automotive industry in the world consisting of firms like BMW Daimler Opel and Volkswagen One would hence expect great interest and a proactive stance from both the firms as well as the government in supporting this innovation
