Hwang, 1991 Three multigrid algorithms are described that can solve the symmetric generalized eigenvalue problem
encountered in structural dynamics First the multigrid algorithm for solving linear matrix equations is incorporated into the
subspace iteration and block Lanczos methods to produce implicit subspace and Lanczos multigrid methods The nested
iteration technique is adopted to produce the initial trial vectors Second the basic multigrid idea of fine mesh relaxation
followed by a coarse mesh correction is explicitly applied to the eigenvalue problem to produce an explicit multigrid method
The nested iteration technique is also used to provide information on the coarse meshes and to produce good initial
approximations to the fine mesh eigensolutions Particular attention is paid to the implementation of these methods on vector
and shared memory parallel supercomputers Several large scale problems are used to study the convergence behavior and
computational performance of the methods The vector and parallel performance of the algorithms are tested using an Alliant
