Differential Flatness in Control Systems

The image is a collage of various elements related to control theory and differential flatness. At the top left is a clock icon. Below it is a landscape with a green hill and two red dots. To the right is a lightbulb icon surrounded by colorful lines. In the center, there is a blue hexagonal logo with a white 'C' and two white '+' signs. Below the logo are two dark grey banners with the words 'FOLLOW' and 'CLAPS' in white capital letters. To the left of the banners is a control block diagram with 'Inputs' and 'Outputs' labels, and a feedback loop labeled 'Feedback'. Below the control block is a Bode plot showing the magnitude response of a system for different values of a parameter c (1, 2, 3, 4, 5, 10, 20, 50, 100). The plot shows a resonance peak that shifts and changes in height as c increases. At the bottom right is a diagram of a cart-pole system, showing a cart of mass M on wheels, a pole of length l and mass m attached to the cart, and an angle θ between the pole and the vertical. A coordinate system with x and y axes is shown. The text '@kaermorhen97' is at the bottom right.

Nonlinear Control and Filtering Using Differential Flatness Approaches Gerasimos G. Rigatos,2015-06-05 This monograph presents recent advances in differential flatness theory and analyzes its use for nonlinear control and estimation It shows how differential flatness theory can provide solutions to complicated control problems such as those appearing in highly nonlinear multivariable systems and distributed parameter systems Furthermore it shows that differential flatness theory makes it possible to perform filtering and state estimation for a wide class of nonlinear dynamical systems and provides several descriptive test cases The book focuses on the design of nonlinear adaptive controllers and nonlinear filters using exact linearization based on differential flatness theory The adaptive controllers obtained can be applied to a wide class of nonlinear systems with unknown dynamics and assure reliable functioning of the control loop under uncertainty and varying operating conditions The filters obtained outperform other nonlinear filters in terms of accuracy of estimation and computation speed The book presents a series of application examples to confirm the efficiency of the proposed nonlinear filtering and adaptive control schemes for various electromechanical systems These include industrial robots mobile robots and autonomous vehicles electric power generation

electric motors and actuators power electronics internal combustion engines distributed parameter systems and communication systems

Differential Flatness Based Design, Planning and Control for Classes of Under-actuated Systems Vivek Sangwan, 2010 Under actuated systems arise in numerous situations In certain applications such as walking robots it is unavoidable as there are phases in walking cycle where the leg tips along the heel or the toes Under actuation can be a better design choice for robots in space and industrial applications due to cost and dead weight considerations Another instance where under actuation finds application is in restoring operation in spite of actuator failure Control of nonlinear under actuated systems is an area of ongoing research In general for an under actuated system not all state trajectories are dynamically feasible and it is hard to characterize feasible trajectories analytically Even if a feasible trajectory is found designing a controller for an under actuated system is also a difficult task Differential flatness if applicable provides a systematic unified approach to i plan dynamically feasible trajectories and ii design a controller that can track those trajectories However a nonlinear under actuated system may not be differentially flat This work presents an approach to design under actuated systems to be differentially flat enabling a systematic trajectory planning and control The design methodology has two parts i a recursive inertia distribution scheme that places the center of mass COM of links at specific locations and ii an actuator and torque spring placement scheme This approach for Design Planning and Control is applied to two classes of under actuated systems i Planar Open Chain Manipulators and ii Bipedal Walking Robots Feasible trajectories are constructed using SQP based numerical optimization The optimization algorithm allows to find trajectories that satisfy motion constraints such as limit on torques for serial chain manipulator ground clearance of the swinging leg for walking robot etc A linear full state feedback controller is designed in the flat output domain to track desired trajectories Results from trajectory planning and dynamic simulations of flatness based tracking are presented for both systems Based on the design methodology experimental prototypes of i a three degree of freedom DOF under actuated manipulator and ii a four link bipedal robot have been fabricated The flatness based control methodology is experimentally demonstrated using the 3 DOF robotic arm Effect of two

kinds of non idealities on the flatness based controller is studied i parametric uncertainties and ii unmodeled viscous friction at unactuated joints For parametric uncertainties it is shown that under certain conditions a robust controller can be designed For viscous friction it is shown that i for the original set of flat outputs a stable internal dynamics is induced and ii the system remains differentially flat with an alternate set of outputs Results from tracking simulations for both conditions are presented This work essentially integrates the Planning and Control of Under Actuated Mechanical Systems with their Design It has been demonstrated by simulations and experiments that certain classes of under actuated systems can be designed to be differentially flat enabling a systematic trajectory planning and control It is also shown that certain types of non idealities can be compensated with a robust control strategy or a modification in the flat outputs With additional design features such as locks at unactuated joints these designs can potentially provide a cheaper alternative for fully actuated robots in applications where point to point motion is desired This work suggests that it can be beneficial to design a system not just from the perspective of the actual task at hand but also from the perspective of Planning and Control

Control of Higher-Dimensional PDEs Thomas Meurer, 2012-08-13 This monograph presents new model based design methods for trajectory planning feedback stabilization state estimation and tracking control of distributed parameter systems governed by partial differential equations PDEs Flatness and backstepping techniques and their generalization to PDEs with higher dimensional spatial domain lie at the core of this treatise This includes the development of systematic late lumping design procedures and the deduction of semi numerical approaches using suitable approximation methods Theoretical developments are combined with both simulation examples and experimental results to bridge the gap between mathematical theory and control engineering practice in the rapidly evolving PDE control area The text is divided into five parts featuring a literature survey of paradigms and control design methods for PDE systems the first principle mathematical modeling of applications arising in heat and mass transfer interconnected multi agent systems and piezo actuated smart elastic structures the generalization of flatness based trajectory planning and feedforward control to parabolic and biharmonic PDE systems defined on general higher dimensional domains an extension of the backstepping approach to the feedback control and observer design for parabolic PDEs with parallelepiped domain and spatially and time varying parameters the development of design techniques to realize exponentially stabilizing tracking control the evaluation in simulations and experiments Control of Higher Dimensional PDEs Flatness and Backstepping Designs is an advanced research monograph for graduate students in applied mathematics control theory and related fields The book may serve as a reference to recent developments for researchers and control engineers interested in the analysis and control of systems governed by PDEs
