

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a gasket seat or groove seat. They are a gasket with an application on all three and high compressions used to increase the quality. A gasket is used to maintain the pressure in a cylinder or other part of a system throughout the life cycle application. The gasket compresses to fill the irregularities between the mating surfaces of the system. This is done by creating a uniform layer of compression. The gasket is used to seal the combustion chamber between the mating surfaces. If the gasket seating surface is not flat, the gasket will be compressed through the life of the application and should be replaced for a gasket.

In order to determine the application requirements, the gasket designer or engineer, the gasket manufacturer or other user, must first determine the application requirements. Every gasket application or design has its own unique characteristics that must be addressed by specifying the performance of each the gasket in an system or other application.
