

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a gasket seat or groove seat. They are a gasket with an application on all three and high compressions used to increase the quality. A gasket is used to maintain the pressure in a cylinder or other part of a system throughout the life cycle application. The gasket compresses to fill the irregularities between the mating surfaces of the system. This is done by creating a seal between the gasket and the mating surfaces. The gasket is used to seal the mating surfaces. If the gasket seating surface is not flat, the gasket will be compressed through the life of the application and should be replaced by a gasket.

In order to determine the application requirements, the gasket designer or engineer should determine the gasket requirements in advance. Every gasket application or design has its own requirements. The gasket designer or engineer should be able to determine the requirements of the gasket in an application or other application.
