*IASTM* Nikita A. Vizniak,2020      **Development of a Mechatronics Instrument Assisted Soft Tissue Mobilization (IASTM) Device to Quantify Force and Orientation Angles** Ahmed Mohammed Alotaibi,2016 Instrument assisted soft tissue mobilization IASTM is a form of massage using rigid manufactured or cast devices The delivered force which is a critical parameter in massage during IASTM has not been measured or standardized for most clinical practices In addition to the force the angle of treatment and frequency play an important role during IASTM As a result there is a strong need to characterize the delivered force to a patient angle of treatment and stroke frequency This thesis proposes two novel mechatronic designs for a specific instrument from Graston Technique Model GT3 which is a frequently used tool to clinically deliver localize pressure to the soft tissue The first design is based on compression load cells where 4 load cells are used to measure the force components in three dimensional space The second design uses a 3D load cell which can measure all three force components force simultaneously Both designs are implemented with IMUduino microcontroller chips which can also measure tool orientation angles and provide computed stroke frequency Both designs which were created using Creo CAD platform were also analyzed thorough strength and integrity using the finite element analysis package ANSYS Once the static analysis was completed a dynamic model was created for the first design to simulate IASTM practice using the GT 3 tool The deformation and stress on skin were measured after applying force with the GT 3 tool Additionally the relationship between skin stress and the load cell measurements has been investigated The second design of the mechatronic IASTM tool was validated for force measurements using an electronic plate scale that provided the baseline force values to compare with the applied force values measured by the tool The load cell measurements and the scale readings were found to be in agreement within the expected degree of accuracy The stroke frequency was computed using the force data and determining the peaks during force application The orientation angles were obtained from the built in sensors in the microchip

*Rehab to Throw Like a Pro* Edward Martel, Max Wardell, Marcee Wardell, 2019-05-28 This

book serves as a practical guide to maximizing clinicians effectiveness in rehabilitating overhead throwing athletes Topics covered will include throwing mechanics assessment of throwing athletes and manual therapy with the primary focus of this guide being exercise interventions Assessment strategies and exercise interventions will be laid out in a progression that can be easily followed and implemented in the clinic today The inspiration for this book comes from my professional baseball career ending prematurely due to injury Shortly after I made the 40 man roster for the New York Yankees I sustained a shoulder injury that altered my career and life I nearly made it back up to the MLB before sustaining another serious

throwing injury After multiple injuries and surgeries I dedicated my life and future career physical therapy to discovering why throwing injuries occur and how to prevent them The goal of this book is to give clinicians practical tools and interventions that they can add to their toolbox without bogging them down with extraneous material and information My goal for you is that you can make a difference in throwing athletes careers so they don t have to experience the same career ending injuries that I endured

*Comparison of Instrument-assisted Soft Tissue Mobilization and Passive Stretching to Improve Glenohumeral Range of Motion and Function* Troy Mendenhall, 2018 Context The loss of shoulder internal rotation range of motion is common maladaptation that predisposes overhead sport athletes to injury Instrument assisted soft tissue mobilization IASTM has recently been suggested as an alternative to stretching exercises to reestablish normal range of motion Objective To determine the extent to which a 4 week program of traditional stretching plus IASTM improves glenohumeral range of motion compared to stretching alone Our secondary purpose was to measure the effects of these interventions using two patient rated outcome measures of shoulder function Design Prospective cohort study Setting Combined laboratory and field study Participants 20 intercollegiate baseball players 10 in the Stretching IASTM Group age 20 9 0 9 yrs height 180 8 8 1 cm mass 85 7 7 2 kg and 10 in the Stretching group age 19 9 1 4 yrs height 183 4 7 4 cm mass 87 1 8 5 kg Interventions Participants in the Stretching group received a clinician administered shoulder stretching program 5 days week for 4 weeks Participants assigned to the Stretching IASTM group received the same stretching program plus IASTM treatments twice per week for 4 weeks All participants completed the Kerlan Jobe Orthopaedic Clinic Shoulder and Elbow KJOC score and the Functional Arm Scale for Throwers FAST at the beginning and end of the study Main Outcome Measures Shoulder internal rotation external rotation and horizontal adduction passive range of motion PROM glenohumeral total range of motion TROM and the KJOC and the FAST Statistical Analyses Five Group 2 x Time 2 between within ANOVAs were performed a 0 05 We also calculated Pearson correlations between the KJOC and FAST questionnaire scores Results Internal rotation PROM significantly improved from Week 0 to Week 4 in both treatment groups p 0 005 Stretching group mean internal rotation PROM increased 6 3% from 52 8o 8 7o to 56 1o 8 4o while Stretching

IASTM group average internal rotation PROM improved 7.8% from 52.6° to 56.7° over the course of this study. Total range of motion (TROM) improved 3.1% in the Stretching group from 145.2° to 149.7° and 4.2% in the Stretching IASTM group from 143.0° to 149.0° between Week 0 and Week 4 respectively (p = 0.005). The KJOC and the FAST scores were inversely related at both the outset (r = 0.874, p = 0.001) and conclusion of our 4-week intervention (r = 0.765, p = 0.001). Conclusions: While both treatment protocols were effective in increasing glenohumeral internal rotation PROM and TROM, the IASTM protocol we employed did not have a significant effect on any of our disease-oriented outcome measures after 4 weeks. Future research studies should compare the effects of multiple IASTM treatment frequencies and durations to more fully evaluate the capacity of IASTM to create long-term improvements in glenohumeral joint range of motion and function.

The Effect of Instrument Assisted Soft Tissue Mobilization on Iliotibial Band Extensibility and Hip Abduction Strength Jordan Smuts, 2013. The purpose of this investigation was 1) to determine if Graston Technique (GT) is effective in increasing hip adduction ROM and 2) to determine if GT is effective in increasing hip abduction strength. Prior to beginning the study, all subjects were pseudo-randomly assigned by gender in either the Graston Technique (9 males and 13 females) or control group.

**Iastm for Horses** Rachel Meyer, 2023-06-15. This book is a manual for the use of instrument-assisted soft tissue mobilization on horses. It is for equine body workers or horse owners who want to enhance their horse's posture and balance in addition to relieving pain related to musculoskeletal issues. The techniques described in this book were developed after becoming certified in the use of the tools for humans and integrating them with prior training in equine massage.

Development of In-vitro and In-vivo Devices to Study the Mechanobiology of Ligament Healing John Bayard Everingham, 2017. Ligament injuries are the most common sports injury in the United States. The current clinical practice for treating ligament injuries leaves many patients with significant pain and joint laxity for years following the initial injury. Controlled mechanical stimulation of the tissue after injury is necessary for robust healing, but the optimal mechanical environment for ligament healing is not fully understood. Alternative therapies such as instrument-assisted soft tissue mobilization (IASTM) offer a form of mechanical stimulation that is non-invasive and has shown promising clinical outcomes, but the optimal dosage for IASTM treatments is unknown. The objective of this study was to develop in vitro and in vivo experimental devices that can help determine the specific mechanical loads that strengthen and accelerate ligament healing. Two devices were developed: The in vitro device is a novel multi-axis mechanical stimulation bioreactor that can accurately apply tensile and combined tensile/compressive stress states to 3D fibroblast-seeded tissue constructs. The bioreactor consists of two independently controlled actuators (one tensile, one compressive), a tablet computer, and data acquisition hardware. The bioreactor was validated using gelatin constructs to simultaneously apply cyclic forces from 0.02 N with an accuracy of approximately 0.01 N and a high degree of repeatability. The in vivo device is a hand-held device to control the frequency and magnitude of applied force during IASTM treatments on rats after ligament transection. The device consists of

a force sensor tablet computer and custom software to guide the application of user specified loading parameters during IASTM treatments The device accuracy was measured by applying a combination of force and stroke frequencies to rigid foam and was experimentally validated over a 3 week animal experiment The device was demonstrated to apply forces between 0.5N at frequencies from 0.1Hz with a high degree of accuracy and repeatability The devices validated in this study provide a framework for future studies The in vitro device can provide insight into the mechanobiological effects of different loading configurations on fibroblast seeded constructs including the simultaneous application of tensile and compressive loading which is similar to IASTM treatment The in vivo device will be used to perform animal studies that can assess the effects of varying applied force and frequency parameters during IASTM treatments Boise State University ScholarWorks

Abhinaba Bhattacharjee,2019 Soft tissue manipulation is a widely used practice by manual therapists from a variety of healthcare disciplines to evaluate and treat neuromusculoskeletal impairments using mechanical stimulation either by hand massage or specially designed tools The practice of a specific approach of targeted pressure application using distinguished rigid mechanical tools to breakdown adhesions scar tissues and improve range of motion for affected joints is called Instrument Assisted Soft Tissue Manipulation IASTM The efficacy of IASTM has been demonstrated as a means to improve mobility of joints reduce pain enhance flexibility and restore function However unlike the techniques of ultrasound traction electrical stimulation etc the practice of IASTM doesn t involve any standard to objectively characterize massage with physical parameters Thus most IASTM treatments are subjective to practitioner or patient subjective feedback which essentially addresses a need to quantify therapeutic massage or IASTM treatment with adequate treatment parameters to document better analyze compare and validate STM treatment as an established state of the art practice This thesis focuses on the development and implementation of Quantifiable Soft Tissue Manipulation QSTM Technology by designing an ergonomic portable and miniaturized wired localized pressure applicator medical device Q1 for characterizing soft tissue manipulation Dose load response in terms of forces in Newtons pitch angle of the device stroke frequency of massage

measured within stipulated time of treatment all in real time has been captured to characterize a QSTM session A QSTM PC software Q WARE featuring a Treatment Record System subjective to individual patients to save and retrieve treatment diagnostics and a real time graphical visual monitoring system has been developed from scratch on WINDOWS platform to successfully implement the technology This quantitative analysis of STM treatment without visual monitoring has demonstrated inter reliability and intra reliability inconsistencies by clinicians in STM force application While improved consistency of treatment application has been found when using visual monitoring from the QSTM feedback system This system has also discriminated variabilities in application of high medium and low dose loads and stroke frequency analysis during targeted treatment sessions
