Liu, 2008 *Evolvable Hardware* Tetsuya Higuchi, Xin Yao, 2006-11-02 Evolvable hardware EHW refers to hardware whose architecture structure and functions change dynamically and autonomously in order to improve its performance in carrying out tasks The emergence of this field has been profoundly influenced by the progress in reconfigurable hardware and evolutionary computation Traditional hardware can be inflexible the structure and its functions are often impossible to change once it is created However most real world problems are not fixed they change with time In order to deal with these problems efficiently and effectively different hardware structures are necessary EHW provides an ideal approach to make hardware soft by adapting the structure to a problem dynamically The contributions in this book provide the basics of reconfigurable devices so that readers will be fully prepared to understand what EHW is why it is necessary and how it is designed The book also discusses the leading research in digital analog and mechanical EHW **Wind Energy Systems**

John Dalsgaard Sørensen, Jens N Sørensen, 2010-12-20 Large scale wind power generation is one of the fastest developing sources of renewable energy and already makes a substantial contribution to power grids in many countries worldwide With technology maturing the challenge is now to increase penetration and optimise the design construction and performance of wind energy systems Fundamental issues of safety and reliability are paramount in this drive to increase capacity and efficiency Wind energy systems Optimising design and construction for safe and reliable operation provides a comprehensive review of the latest developments in the design construction and operation of large scale wind energy systems including in offshore and other problematic environments Part one provides detailed coverage of wind resource assessment and siting methods relevant to wind turbine and wind farm planning as well as aeroelastics aerodynamics and fatigue loading that affect the safety and reliability of wind energy systems This coverage is extended in part two where the design and development of individual components is considered in depth from wind turbine rotors to drive train and control systems and on to tower design and construction Part three explores operation and maintenance issues such as reliability and maintainability strategies and condition monitoring systems before discussing performance assessment and optimisation

Books Rose Army,1999 The Elements of MATLAB Style Richard K. Johnson,2011 A guide for MATLAB programmers that offers a collection of standards and guidelines for creating MATLAB code that will be easy to understand enhance and maintain **MATLAB and Simulink Code Generation** F Marquez,2019-04-07 Generating code from MATLAB algorithms for desktop and embedded systems allows you to perform your software design implementation and testing completely within the MATLAB workspace You can Verify that your algorithms are suitable for code generation Generate efficient readable and compact C C code automatically which eliminates the need to manually translate your MATLAB algorithms and minimizes the risk of introducing errors in the code Modify your design in MATLAB code to take into account the specific requirements of desktop and embedded applications such as data type management memory use and speed Test the generated code and easily verify that your modified algorithms are functionally equivalent to your original MATLAB algorithms Generate MEX functions to Accelerate MATLAB algorithms in certain applications Speed up fixed poin MATLAB code Generate hardware description language HDL from MATLAB code To generate C C or MEX code from MATLAB algorithms you must install the following software MATLAB Coder product C C compiler When writing MATLAB code that you want to convert into efficient standalone C C code you must consider the following Data types C and C use static typing To determine the types of your variables before use MATLAB Coder requires a complete assignment to each variable Array sizing Variable size arrays and matrices are supported for code generation You can define inputs outputs and local variables in MATLAB functions to represent data that varies in size at run time Memory You can choose whether the generated code uses static or dynamic memory allocation With dynamic memory allocation you potentially use less memory at the expense of time to manage the memory With static memory you get better speed but with higher memory usage Most MATLAB code takes advantage of the dynamic sizing features in MATLAB therefore dynamic memory allocation typically enables you to generate code from existing MATLAB code without modifying it much Dynamic memory allocation also allows some programs to compile even when upper bounds cannot be found Static allocation reduces the memory footprint of the generated code and therefore is suitable for applications where there is a limited amount of available memory such as embedded applications **A**
