ABSTRACT

The aim of this article is to present a case study of usage of one of the data mining methods, neural network, in knowledge discovery from databases in the banking industry. Data mining is automated process of analysing, organization or grouping a large set of data from different perspectives and summarizing it into useful information using special algorithms. Data mining can help to resolve banking problems by finding some regularity, causality and correlation to business information which are not visible at first sight because they are hidden in large amounts of data. In this paper, we used one of the data mining methods, neural network, within the software package Alyuda NeuroIntelligence to predict customer churn in bank. The focus on customer churn is to determinate the customers who are at risk of leaving and analysing whether those customers are worth retaining. Neural network is statistical learning model inspired by biological neural and it is used to estimate or approximate functions that can depend on a large number of inputs which are generally unknown. Although the method itself is complicated, there are tools that enable the use of neural networks without much prior knowledge of how they operate. The results show that clients who use more bank services (products) are more loyal, so bank should focus on those clients who use less than three products, and offer them products according to their needs. Similar results are obtained for different network topologies.

Predicting Customer Churn in the Telecommunication Industry Anne-Sophie Hadaschik,2017 The increasing occurrence of customer churn that implies customers discontinuation of their current relationship with a service provider has forced many companies in competitive markets to redirect their strategic focus to consider customer acquisition and customer retention equally In particular in the telecommunication industry a high degree of saturation and competition contributed to ever increasing churn rates However resources of marketing managers to develop valid churn prediction and retention techniques are finite The aim of this study is to identify customers which are likely to churn with a constrained and thus limited set of characteristics Therefore this study investigates the churn behavior of customers of a German telecommunication company The study s finding underline the usefulness of logistic regression when building a churn prediction model Furthermore the research shows that a limited number of explanatory variables are sufficient to predict churn with proficient accuracy so that companies may carry out suitable actions to prevent customer churn In detail the study identifies a distinct correlation between customer churn behavior and attributes of customer contract history as well as certain demographic variables In order to focus on profitable customers when managing churn a classification approach is computed to improve marketing spending This thesis encourages companies to justify or expand measurements against churn by proposing an easier and more cost effective means for customer churn prediction *Understanding Customer Loyalty and Deposit Stability* Ryan Kottmann,2024 Identifying the causes of customer churn in any institution is an increasingly important part of maintaining a profitable business No where is this more true than in the banking sector in which client deposits are the life blood of banks This analysis focused on analyzing features from a publicly available data set

Predicting Customer Wallet Nicolas Glady, 2008 Each consumer requires a certain quantity of services or products and a single company usually provides only a part of this In the banking sector the total quantity of business a customer does is called the Size of Wallet of this customer and it is generally unobservable From a company perspective the percentage of this business done with the company is called the Share of Wallet of this customer and is usually unobservable as well This paper focuses on the prediction of these values and on the derived concept of Potential of Wallet which is the difference between the Size of Wallet and the actual business the customer does with the focal company In the existing literature the models predicting the customer s wallet need survey data to estimate the model parameters The main contribution of this paper is to propose an approach to predict the customer s wallet without using survey data In the empirical application we show that a company can generate substantial gains by targeting customers having a large Potential of Wallet
