

## Test 11A

### Part I

- c** Null hypotheses should refer to the distribution of the population, not observed values. In this setting, the null is that all flavors have equal popularity, so the population proportion preferred is the same for each flavor.
- b** Statement I is a condition for a one-sample z-test for a difference of proportions. Statements II and III are both conditions for a chi-square test.
- e** Each component of a chi-square statistic is  $\frac{(\text{Observed} - \text{Expected})^2}{\text{Expected}}$  for the given cell.
- a** For a chi-square test for homogeneity, the null hypothesis is that the distribution of a categorical variable is the same for two or more different populations. There are two random samples in this setting from two distinct populations, hence it is not a test of independence.
- c** Expected counts in a two-way table =  $\frac{\text{row total} \times \text{column total}}{\text{grand total}}$ .
- e** For a  $2 \times 4$  table, degrees of freedom =  $1 \times 3 = 3$ . From Table C,  $\chi^2 = 4.629$  with  $df = 3$  produces a  $P$ -value between 0.20 and 0.25.
- c** Degrees of freedom for any chi-square test involving a 2-way table is  $(\text{number of rows} - 1)(\text{number of columns} - 1)$ .
- b** A large component indicates a large difference between observed and expected counts. While the cells referred to in both **a** and **b** have large components, only in choice **b** is the observed count larger than the expected count. (In choice **a**, observed is smaller than expected.)
- d** All chi-square distributions are skewed right, not roughly symmetric. II and III are both correct statements—see the description of the chi-square distributions on page 685 in the text.
- d**  $H_0$  is that there is no association between car color and proportion of cars involved in accidents. Since the  $P$ -value is greater than  $\alpha$ , we fail to reject the null hypothesis, which means we do not have evidence that there is an association. Failing to reject  $H_0$  does not mean the same thing as accepting  $H_0$ ; the test only provides evidence against the null, not for it. So (b) is incorrect.
