potential user than long In this guide we're going to explain to you what the blockchain technology is and what its strengths and weaknesses are so you can enjoy the Beginners Guide on Blockchain Technology. And if you don't know what blockchain is and want to become a blockchain developer, look out for the blockchain tutorial and start your very first blockchain. A blockchain is the multi-transaction time-stamped series of immutable records of data that must be distributed and not owned by any individual. Each of the blocks of data is bound to the previous block in the chain. So what's the point and why are we saying that? The distributed capabilities of the blockchain network is the very foundation of a democratized system. Since it is a hard and immutable ledger, the information is not for anyone and everyone to hide anything that built on the blockchain but very nature transparent and very involved, accountable for the return.

Blockchain Technology Tim D. Washington, 2019-02-26 Learn more about BLOCKCHAIN TECHNOLOGY Blockchain is a decentralized ledger of transactions. You can look at blockchain as a large database of records that is managed by different people including you instead of counting on certain organizations to manage your data. You can think of it as a spreadsheet that is sent over a network of computers which is made in order to regulate the spreadsheet so everybody can make sure every record in it is correct. As what the term blockchain suggests, each procedure of every transaction is kept as a block which links to everything that comes after it. The said blocks are then stored in a network where everyone has a copy of the block so that they can be easily accessed. However, each block is protected by a certain key so it doesn't get tampered by anyone within the network. What does that mean then? Currently, every file or record that is important to you is managed by an organization that you trust: banks, insurance providers, credit card companies, the government, human resources, and other similar bodies exist because of the value of trust that people give them. Because they operate with the virtue of trust, these organizations are the ones that manage most if not all of the transactions that involve money. To make sure that your records and transactions are protected, your data is made safe in a centralized database that only certified personnel are authorized to access. While blockchain promises to distribute data in such a way that there is not a single processor that would be handling it. For example, instead of having one or a couple of servers storing data for an insurance company, everybody that is joined to a network will have access to insurance data. Yes, that's right, this would also mean that your data is going to be shared between several people that needs to come to an agreement on its integrity. Blockchain may seem like a jargon at the moment, most of the things that you come across in your daily life are bound to be transformed by this concept. This seemingly imminent concept is already here and is little by little being adapted in economics, trade, and even in the most straightforward transactions that you do.
