(Chapter – 1) (Sexual Reproduction in Flowering Plants)
(Class – XII)

Answer 4:

An ovule is a female megasporangium where the formation of megaspores takes place.

The various parts of an ovule are –

- ▶ **Funiculus** – It is a stalk-like structure which represents the point of attachment of the ovule to the placenta of the ovary.
- ▶ **Hilum** – It is the point where the body of the ovule is attached to the funiculus.
- ▶ **Integuments** – They are the outer layers surrounding the ovule that provide protection to the developing embryo.
- ▶ **Micropyle** – It is a narrow pore formed by the projection of integuments. It marks the point where the pollen tube enters the ovule at the time of fertilization.
- ▶ **Nucellus** – It is a mass of the parenchymatous tissue surrounded by the integuments from the outside. The nucellus provides nutrition to the developing embryo. The embryo sac is located inside the nucellus.
- ▶ **Chalazal** – It is the based swollen part of the nucellus from where the integuments originate.

Question 5:

What is meant by monosporic development of female gametophyte?

Answer 5:

The female gametophyte or the embryo sac develops from a single functional megaspore. This is known as monosporic development of the female gametophyte. In most flowering plants, a single megaspore mother cell present at the micropylar pole of the nucellus region of the ovule undergoes meiosis to produce four haploid megaspores. Later, out of these four megaspores, only one functional megaspore develops into the female gametophyte, while the remaining three degenerate.
